Cold and ultracold collisions occupy a strategic position at the intersection of several powerful themes of current research in chemical physics, in atomic, molecular and optical physics, and even in condensed matter. The nature of these collisions has

important consequences for optical manipulation of inelastic and reactive processes, precision measurement of molecular and atomic properties, matter-wave coherences and quantum-statistical condensates of dilute, weakly interacting atoms. This crucial position explains the wide interest and explosive growth of the field since its inception in 1987. The author reviews elements of the quantum theory of scattering theory, collisions taking place in the presence of one or more light fields, and collisions in the dark, below the photon recoil limit imposed by the presence of any light field. Finally, it reviews the essential properties of these mesoscopic quantum systems and describes

the key importance of the scattering length to condensate stability.

Women, Work and the Japanese Economic Miracle CRC Press

This book shows how, during the period of the Japanese economic miracle, a distinctive female employment system was developed alongside, and different from, the better known Japanese employment system which was applied to male employees. *Women, Work and the Japanese Economic Miracle* describes and analyses the place of female workers in the cotton textile industry, which was a crucially important industry with a large workforce. In presenting detailed data on such key issues as recruitment systems, management practices and the working experience of the women involved, it demonstrates the importance for Japan's postwar economy of harnessing female labour during these years.

Electric Field Analysis is both a student-friendly textbook and a valuable tool for engineers and physicists engaged in the design work of high-voltage insulation systems. The text begins by introducing the physical and mathematical fundamentals of electric fields,

presenting problems from power and dielectric engineering to show how the theories are put into practice. The book then describes various techniques for electric field analysis and their significance in the validation of numerically computed results, as well as: Discusses finite difference, finite element, charge simulation, and surface charge simulation methods for the numerical computation of electric fields Provides case studies for electric field distribution in a cable termination, around a post insulator, in a condenser bushing, and around a gas-insulated substation (GIS) spacer Explores numerical field calculation for electric field optimization, demonstrating contour correction and examining the application of artificial neural networks Explains how high-voltage field optimization studies are carried out to meet the desired engineering needs *Electric Field Analysis* is accompanied by an easy-to-use yet comprehensive software for electric field computation. The software, along with a wealth of supporting content, is available for download with qualifying course adoption.

One of the biggest challenges for students of housing is understanding the financial principles which underpin the place of housing in the wider economy. By taking a

political economy approach, Peter King's *Understanding Housing Finance* makes the basic principles of the subject accessible, without requiring detailed prior knowledge of economics or financial systems. The book explains housing finance by exploring the way in which markets and governments react together. It takes a conceptual approach to consider the advantages and limits of housing markets and why governments intervene. The consequences of intervention are explored in detail using examples of housing subsidy systems and policy mechanisms such as rent control, housing allowances and subsidies to owner occupation. This is a key reference for students on housing and planning courses at both undergraduate and postgraduate level. The

book's approach means that its relevance is not confined to one particular housing system, but is useful for those studying housing finance in most developed and developing countries.

When the war ended on August 15, 1945, I was a naval engineering cadet at the Kure Navy Yard near Hiroshima,

Japan. A week later, I was demobilized and returned to my home in Tokyo, fortunate not to find it ravaged by firebombing. At the beginning of September, a large contingent of the American occupation forces led by General Douglas MacArthur moved its base from Yokohama to Tokyo. Near my home I watched a procession of American military motor vehicles snaking along Highway 1. This truly awe-inspiring cavalcade included jeeps, two-and-a-half-ton trucks, and enormous trailers mounted with tanks and artillery. At the time, I was a 21-year-old student in the Machinery Section of Engineering at the Tokyo Imperial University. Watching that magnificent parade of military vehicles, I was more than impressed by the gap in industrial strength between

Japan and the U. S. That realization led me to devote my whole life to the development of the Japanese auto industry. I wrote a small article concerning this incident in Nikkei Sangyo Shimbun (one of the leading business newspapers in Japan) on May 2, 1983. The English translation of this story was carried in the July 3, 1983 edition of the Topeka Capital-Journal and the September 13, 1983 issue of the Asian Wall Street Journal. The Topeka Capital-Journal headline read, "MacArthur's Jeeps Were the Toyota Catalyst.
