Trainers must be prepared to provide traditional training and to help design original training systems that make it possible to build up new professional identities. The existing literature provides a clear view of the demand for training for trainers. Studies are now focusing on ways in which the training supply is meeting this demand. Some problems raised by trainers in basic vocational training are limited autonomy and little opportunity for educational innovation, obstacles to student and teacher mobility among Member States of the European Community, and unattractive career advancement and salaries. Trainers in continuing education who have opportunities for greater initiative and autonomy cite these trends: emergence of a more clearly defined training management function, use of outside services, decrease in relative numbers of full-time trainers in enterprise, decentralization of training, and increasing importance of training needs analysis. Studies suggest distinctions among teachers, full-time trainers, and occasional trainers. Specialists in educational engineering and training engineering and training management specialists and technicians are also emerging. The question is how to envisage the training of trainers in a period of transition between the current destructuring stage and establishment of a new integrating cultural model which entails a genuine change of culture. Other problems are opening up access and increasing use of the supply of training. (YLB)

Whether you're writing fiction or non-fiction, or intend to publish traditionally or self-publish, author Nina Amir will teach you how to conduct an effective competitive analysis for your work and do a better job at delivering the goods to readers than similar books that are already on the shelf. This book presents an updated description of The Picture Exchange Communication System (PECS). It begins with a discussion of the "big picture," or the authors view on the importance of laying the foundation for communication training by systematically structuring the learning environment (be it in the home, community or school). This approach, The Pyramid Approach to Education, embraces the principals of broad-spectrum applied behavior analysis and emphasizes the development of functional communication skills, independent of communication modality. The Pyramid Approach is one of the few approaches that encourages creativity and innovation on the teacher's part through databased decision making.

The fundamental mathematical tools needed to understand machine learning include linear algebra, analytic geometry, matrix decompositions, vector calculus, optimization, probability and statistics. These topics are traditionally taught in disparate courses, making it hard for data science or computer science students, or professionals, to efficiently learn the mathematics. This self-contained textbook bridges the gap between mathematical and machine learning texts, introducing the mathematical concepts with a minimum of prerequisites. It uses these concepts to derive four central machine learning methods: linear regression, principal component analysis, Gaussian mixture models and support vector machines. For students and others with a mathematical background, these derivations provide a starting point to machine learning texts. For those learning the mathematics for the first time, the methods help build intuition and practical experience with applying mathematical concepts. Every chapter includes worked examples and exercises to test understanding. Programming tutorials are offered on the book's web site.
