A mathematical puzzle book that involves labeling points or edges

on three types of graphs: (1) polycubes, which consist of cubes attached face-to-face, (2) polyhexes, which consist of regular hexagons joined edge to edge, and (3) triangulations, which consist of triangles attached edge to edge. For a polycube with  $n$  points, the puzzle consists of labeling each vertex with the full set of integers  $(\text{mod } n)$ ,  $(\mathbb{Z}_n)$  so that the four labels belonging to each face of every component cube have the same sum. For a polyhex with  $n$  points, the vertices are to be labeled with elements from  $\mathbb{Z}_n$  so that the six labels assigned to each component hexagon have the same sum. For puzzles involving triangulation, the edges, instead of the vertices, are to be labeled with elements of  $\mathbb{Z}_n$ . To solve the puzzle, a labeling must be found so that the edges of each component triangle have the same sum. Unlike sudoku, these puzzles have many solutions; the solutions provided in the back of the book are included just to show that a solution exists. Readers are encouraged to create and solve their own puzzles in any of the

three genres. Questions of mathematical interest are provided throughout.

It's the new shape of sudoku?and it's no square! These fun and extra-challenging puzzles come in triangles, all color-coded to indicate special spaces where numbers can't repeat and where new rules of play come into action. Each large triangle includes nine smaller ones (just as the square grids feature interior boxes); as usual, you must place numbers one to nine in each triangle. But then solvers face some unique (and exciting!) requirements for filling in the edges, for completing the "three legs" of the inner shaded triangle, and for handling the hexagon shapes. Fans of traditional sudoku will find it irresistible!
