Physical rehabilitation for walking recovery after spinal cord injury is undergoing a paradigm shift. Therapy historically has focused on compensation for sensorimotor deficits after SCI using wheelchairs and bracing to achieve mobility. With locomotor training, the aim is to promote recovery via activation of the neuromuscular system below the level of the lesion. What basic scientists have shown us as the potential of the nervous system for plasticity, to learn, even after injury is being translated into a rehabilitation strategy by taking advantage of the intrinsic biology of the central nervous system. While spinal cord injury from basic and clinical perspectives was the gateway for developing locomotor training, its application has been extended to other populations with neurologic dysfunction resulting in loss of walking or walking disability.

SIMS' SYMPTOMS IN THE MIND has, since its first publication in 1988, become established as the leading introductory textbook on clinical psychopathology. This new edition has been fully updated to include advances in neuropsychology and cognitive neuroscience and changes can be found in the chapters on memory disturbance, disorders of time, pathology of perception, disorders of speech and language, affect and emotional disorders, and disorders of volition and execution. In some cases, novel classifications of the abnormalities under consideration have been provided together with additional pathological phenomena - including palinopsia, akinetopsia, zeittraffer phenomenon, exosomesthesia - many of which have been rediscovered or

imported from neurology. The popular and distinctive features are the use of figures, tables and illustrative case examples which have been further enhanced with additional case examples from the classical literature, autobiographical narratives and fiction. New section headings provide firmer thematic unity to the content Check boxes summarize important points such as classification of particular areas Additional examples of psychopathology are included which are drawn from a wide source including fiction, autobiography and clinical textbooks Includes an extended range of abnormalities, including those which have previously been neglected, such as alloaesthesia, palinaptia, teleopsia, pelopsia, akinetopsia, palinopsia, and parapsopria Fully updated description of the theoretical aspects of memory and its disturbance Fully integrated neuropsychological concepts of imagery and internal mental representations in the chapter on abnormalities of perception

This Handbook contains a unique collection of
chapters written by the world's leading researchers in
the dynamic field of consumer psychology.

Although these researchers are housed in different
academic departments (ie. marketing, psychology,
advertising, communications) all have the common
goal of attaining a better scientific understanding of
cognitive, affective, and behavioral responses to
products and services, the marketing of these
products and services, and societal and ethical
concerns associated with marketing processes.

Consumer psychology is a discipline at the interface
of marketing, advertising and psychology. The
research in this area focuses on fundamental
psychological processes as well as on issues
associated with the use of theoretical principles in
applied contexts. The Handbook presents state-of-
the-art research as well as providing a place for
authors to put forward suggestions for future
research and practice. The Handbook is most
appropriate for graduate level courses in marketing,

Decades of research have demonstrated that the
parent-child dyad and the environment of the
family â € "which includes all primary
caregivers â € "are at the foundation of children's
well- being and healthy development. From birth,
children are learning and rely on parents and the
other caregivers in their lives to protect and care for
them. The impact of parents may never be greater
than during the earliest years of life, when a child's
brain is rapidly developing and when nearly all of her
or his experiences are created and shaped by parents
and the family environment. Parents help children
build and refine their knowledge and skills, charting a
trajectory for their health and well-being during
childhood and beyond. The experience of parenting
also impacts parents themselves. For instance,
parenting can enrich and give focus to parents' lives;
generate stress or calm; and create any number of
emotions, including feelings of happiness, sadness,
fulfillment, and anger. Parenting of young children
today takes place in the context of significant
ongoing developments. These include: a rapidly
growing body of science on early childhood,
increases in funding for programs and services for
families, changing demographics of the U.S.
population, and greater diversity of family structure.
Additionally, parenting is increasingly being shaped
by technology and increased access to information
about parenting. Parenting Matters identifies
parenting knowledge, attitudes, and practices
associated with positive developmental outcomes in
children ages 0-8; universal/preventive and targeted
strategies used in a variety of settings that have been
effective with parents of young children and that
support the identified knowledge, attitudes, and
practices; and barriers to and facilitators for parents'
use of practices that lead to healthy child outcomes as
well as their participation in effective programs and
services. This report makes recommendations
directed at an array of stakeholders, for promoting
the wide-scale adoption of effective programs and
services for parents and on areas that warrant further
research to inform policy and practice. It is meant to
serve as a roadmap for the future of parenting policy,
research, and practice in the United States.

This is the first book to address the clinical and
neurobiological interface between schizophrenia and
obsessive-compulsive disorder (OCD). There is
growing evidence that obsessive-compulsive
symptoms in schizophrenia are prevalent, persistent
and characterized by a distinct pattern of familial
inheritance, neurocognitive deficits and brain
activation. This text provides guidelines for
differential diagnosis of schizophrenic patients with
obsessive-compulsive symptoms, and patients with
primary OCD alongside poor insight, psychotic
features or schizotypal personality. Written by a
leading expert in the coexistence of obsessive-
compulsive and schizophrenic phenomena, Schizo-
Obsessive Disorder uses numerous case studies to

present diagnostic guidelines and to describe a
recommended treatment algorithm, demystifying this
complex disorder and aiding its effective
management. The book is essential reading for
psychiatrists, neurologists and the wider range of
multidisciplinary mental health practitioners.

Metaphor has been an issue of intense research
and debate for decades (see, for example [1]).
Researchers in various disciplines, including

linguistics, psychology, computer science, education, and philosophy have developed a variety of theories, and much progress has been made [2]. For one, metaphor is no longer considered a rhetorical flourish that is found mainly in literary texts. Rather, linguists have shown that metaphor is a pervasive phenomenon in everyday language, a major force in the development of new word meanings, and the source of at least some grammatical function words [3]. Indeed, one of the most influential theories of metaphor involves the suggestion that the commonality of metaphoric language results because cross-domain mappings are a major determinant in the organization of semantic memory, as cognitive and neural resources for dealing with concrete domains are recruited for the conceptualization of more abstract ones [4]. Researchers in cognitive neuroscience have explored whether particular kinds of brain damage are associated with metaphor production and comprehension deficits, and whether similar brain regions are recruited when healthy adults understand the literal and metaphorical meanings of the same words (see [5] for a review). Whereas early research on this topic focused on the issue of the role of hemispheric asymmetry in the comprehension and production of metaphors [6], in recent years cognitive neuroscientists have argued that metaphor is not a monolithic category, and that metaphor processing varies as a function of numerous factors, including the novelty or conventionality of a particular metaphoric expression, its part of speech, and the extent of contextual support for the metaphoric meaning (see, e.g., [7], [8], [9]). Moreover, recent developments in cognitive neuroscience point to a sensorimotor basis for many concrete concepts, and raise the issue of whether these mechanisms are ever recruited to process more abstract domains [10]. This Frontiers Research Topic brings together contributions from researchers in cognitive neuroscience whose work involves the study of metaphor in language and thought in order to promote the development of the neuroscientific investigation of metaphor. Adopting an interdisciplinary perspective, it synthesizes current findings on the cognitive neuroscience of metaphor, provides a forum for voicing novel perspectives, and promotes avenues for new research on the metaphorical brain.
