Unit 19 Trusses: Method of Sections  
In this section, we will apply basic finite element techniques to solve general two dimensional truss problems. The technique is a little more complex than that originally used to solve truss problems, but it allows us to solve problems involving statically indeterminate structures. 3.1 Local and Global Coordinates  
Method of Joints | Analysis of Simple Trusses ...  
On a truss problem, it is often helpful to write in values as you solve for them. I have done so above. With AB and AC known, let's look at joint B. Sense of unknown forces is assumed. (You may either make a guess based on intuition, or a perfectly arbitrary assumption.)

Truss examples 1. Examples EX (1): Determine the force in each member of the truss, and state if the members are

in tension or compression. Solution Free Body Diagram: 2. First, we should calculate reactions at A and B:  $\sum M_A = 0$   
 $(2) + (900)(2) + (600)(4) = 0$   
 $\sum F_y = 0$   
 $2100 - N_B = 0$   
 $N_B = 2100 \text{ N}$

The method used to solve truss problems is to: Find the forces at the supports by using force and moment equations with given external forces. Calculate the internal forces of beams connected to a support, keeping in mind which are in compression and which are in tension.

Equilibrium of each joint can be specified by two scalar force equations  $2j$  equations for a truss with "j" number of joints Known Quantities For a truss with "m" number of two force members, and maximum 3 unknown support reactions Total Unknowns =  $m + 3$  ("m" member forces and 3 reactions for externally determinate truss) Therefore:  $m + 3 = 2j$  Statically

To solve this problem by the method of sections, you pass a section (indicated by a line) through three members of the truss, one of which is the desired member. The next step is to draw a free body of one part or the other indicating all known and unknown forces. Here are the free bodies resulting from section 1-1 above.
