Introducing Management in a Global Context New Press, The

In November and December 1967, Dr. Martin Luther King, Jr., delivered five lectures for the renowned Massey Lecture Series of the Canadian Broadcasting Corporation. The collection was immediately released as a book under the title *Conscience for Change*, but after King's assassination in 1968, it was republished as *The Trumpet of Conscience*. The collection sums up his lasting creed and is his final testament on racism, poverty, and war. Each oration in this volume encompasses a distinct theme and speaks prophetically to today's perils, addressing issues of equality, conscience and war, the mobilization of young people, and nonviolence. Collectively, they reveal some of King's most introspective reflections and final impressions of the movement while illustrating how he never lost sight of our shared goals for justice. The book concludes with "A Christmas Sermon on Peace"—a powerful lecture that was broadcast live from Ebenezer Baptist Church on Christmas Eve in 1967. In it King articulates his long-term vision of nonviolence as a path to world peace.

Handbook of Multivalued Analysis Routledge

This book breaks away from standard microeconomics textbooks for management students in numerous ways. Some of its relevant and useful features are: • A strong emphasis on concepts, their explanation, understanding and application • Graphical and logical derivations supplemented by economic intuition in easy-to-understand English, while retaining the rigour of algebraic treatment • Numerous real-life examples, largely pertaining to India • Two unique chapters: Demand for Assets and Game Theory and Economic Applications • Questions at the end of each chapter, emphasising the application of concepts This book will be valuable for BBA and B.Com. students and also for those pursuing Managerial Economics at the Masters level.

Applications of Liquid Scintillation Counting deals with liquid scintillation counting and its applications in fields such as the biosciences, medicine, environmental and space sciences, chemistry, and physics. These applications include dual-labeled counting; Cerenkov counting; radioimmunoassay, chemiluminescence and bioluminescence; pulse shape discrimination; flow cell counting; and large-volume counters. This book is comprised of 18 chapters and begins with a historical overview of the liquid scintillation method, the first liquid scintillation counters, and early scintillator solutes. The following chapters focus on the theory of liquid scintillation counting; the components of the liquid scintillator solution; and the development of the liquid scintillation counter and multiplier phototubes. The discussion then turns to the detection and measurement of different types of particles produced by radionuclides using liquid scintillation techniques; the techniques and problems of sample preparations (homogeneous and heterogeneous); oxidation techniques; and importance and difference of several types of counting vials. The sources of quenching in counting samples and methods of monitoring and correction for variable quench within samples are also considered. Several special applications of liquid scintillation techniques are presented, including dual-labeled counting, radioimmunoassay, and flow cell counting. In conclusion, the statistical considerations involved in determining the reliability and accuracy of data obtained by nuclear counting techniques are highlighted. This monograph will serve as a reliable source of information for those who are already using or starting to use liquid scintillation counting techniques.

In volume I we developed the tools of "Multivalued Analysis." In this volume we examine the applications. After all, the initial impetus for the development of the theory of set-valued functions came from its applications in areas such as control theory and mathematical economics. In fact, the needs of control theory, in particular the study of systems with a priori feedback, led to the systematic investigation of differential equations with a multi valued vector field (differential inclusions). For this reason, we start this volume with three chapters devoted to set-valued differential equations. However, in contrast to the existing books on the subject (i. e. J. -P. Aubin - A. Cellina: "Differential Inclusions," Springer-Verlag, 1983, and Deimling: "Multivalued Differential Equations," W. De Gruyter, 1992), here we focus on "Evolution Inclusions," which are evolution equations with multi valued terms. Evolution equations were raised to prominence with the development of the linear semigroup theory by Hille and Yosida initially, with subsequent important contributions by Kato, Phillips and Lions. This theory allowed a successful unified treatment of some apparently different classes of nonstationary linear partial differential equations and linear functional equations. The needs of dealing with applied problems and the natural tendency to extend the linear theory to the nonlinear case led to the development of the nonlinear semigroup theory, which became a very effective tool in the analysis of broad classes of nonlinear evolution equations.

In the heart of Louisiana, the most powerful people in the South live behind elegant gates, mossy trees, and pleasant masks. Once every ten years, the pretense falls away and a tournament is held to determine who will rule them. The Acquisition is a crucible for the Southern nobility, a love letter written to a time when barbarism was enshrined as law.

Now, Sinclair Vinemont is in the running to claim the prize. There is only one way to win, and he has the key to do it - Stella Rousseau, his Acquisition. To save her father, Stella has agreed to become Sinclair's slave for one year. Though she is at the mercy of the cold, treacherous Vinemont, Stella will not go willingly into darkness. As Sinclair and Stella battle against each other and the clock, only one thing is certain: The Acquisition always ends in blood.

Economic Theory, Econometrics, and Mathematical Economics: *New Quantitative Techniques for Economic Analysis* provides a critical appraisal of the results, the limits, and the developments of well-established quantitative techniques. This book presents a detailed analysis of the quantitative techniques for economic analysis. Organized into four parts encompassing 16 chapters, this book begins with an overview of the general questions concerning models and model making. This text then provides the main results and various interesting economic applications of some quantitative techniques that have not been widely used in the economic field. Other chapters consider the principle of optimality in dynamic programming wherein the infinite sequence of consumption-saving decisions can be reduced to one decision. This book discusses as well the methods for online control and management of large-scale systems. The final chapter deals with special problems. This book is a valuable resource for economists, social scientists, epistemologists, economic historians, and research workers.
