Although once considered a field mainly for men, women can look for all kinds of STEM (science, technology, engineering, and mathematics) careers. Engineering has many opportunities for girls who enjoy STEM topics. This book covers many engineering career opportunities, with workplaces ranging from a laboratory to deep space. It also offers suggestions as to how readers can turn their dreams into dream careers, such as which classes to take in school, scholarships available specifically for women, and college majors and classes that will be instructive, interesting, and give girls a step up to feel confident in trying out a cool engineering career.

World-renowned economist Klaus Schwab, Founder and Executive Chairman of the World Economic Forum, explains that we have an opportunity to shape the fourth industrial revolution, which will fundamentally alter how we live and work. Schwab argues that this revolution is different in scale, scope and complexity from any that have come before. Characterized by a range of new technologies that are fusing the physical, digital and biological worlds, the developments are affecting all disciplines, economies, industries and governments, and even challenging ideas about what it means to be human.

Artificial intelligence is already all around us, from supercomputers, drones and virtual assistants to 3D printing, DNA sequencing, smart thermostats, wearable sensors and microchips smaller than a grain of sand. But this is just the beginning: nanomaterials 200 times stronger than steel and a million times thinner than a strand of hair and the first transplant of a 3D printed liver are already in development. Imagine " smart factories " in which global systems of manufacturing are coordinated virtually, or implantable mobile phones made of biosynthetic materials. The fourth industrial revolution, says Schwab, is more significant, and its ramifications more profound, than in any prior period of human history. He outlines the key technologies driving this revolution and discusses the major impacts expected on government, business, civil society and individuals. Schwab also offers bold ideas on how to harness these changes and shape a better future—one in which technology empowers people rather than replaces them; progress serves society rather than disrupts it; and in which innovators respect moral and ethical boundaries rather than cross them. We all have the opportunity to contribute to developing new frameworks that advance progress.

Despite decades of government, university, and employer efforts to close the gender gap in engineering, women make up only 11 percent of practicing engineers in the United States. What factors influence women graduates' decisions to enter the engineering workforce and either to stay in or leave the field as their careers progress? Researchers are both tapping existing data and fielding new surveys to help answer these questions. On April 24, 2013, the

National Research Council Committee on Women in Science, Engineering, and Medicine held a workshop to explore emerging research and to discuss career pathways and outcomes for women who have received bachelor's degrees in engineering. Participants included academic researchers and representatives from the Department of Labor, National Science Foundation, and Census Bureau, as well as several engineering professional societies. Career Choices of Female Engineers summarizes the presentations and discussions of the workshop.

Using data collection procedures set forth in Air Force Manual 35-2, the Electronics Engineer Air Force officer specialty was surveyed. A job inventory developed by officer incumbents at Wright-Patterson Air Force Base was composed of 117 task statements and a Background Information Sheet. The inventory was completed by 673 electronics engineering officers in 11 major air commands, over 80 per cent of the officers being in the Air Force Systems Command. Analysis of the survey data by means of a hierarchal grouping technique allocated 575 of the officers' jobs to 18 job types, each of which included at least five members. Expected job types reflecting shreds authorized in 1964 were not found. Field grade and company grade officers were grouped together in all except three job types. Job types tended also to cut across commands and organizational levels. Entry level and fully qualified Electronics Engineers performed essentially the same work activities. The part of the job allocated to planning, directing, supervising, and coordinating duties increased with grade, but allocation decreased with grade for evaluating and performing duties. Computer printouts of the definitive tasks for officer grades surveyed and for the 17 job types identified are shown in appropriate tables. (Author).

EVERYWHERE YOU LOOK, YOU WITNESS the work of structural engineers. These professionals are responsible for ensuring that every structure is safe and sound, whether it is a building, vehicle, or part of infrastructure. They study how to make buildings withstand the onslaught of earthquakes, hurricanes, extreme weather, and other natural forces. They improve the way structures are built, help minimize the impact of construction on our planet, introduce new and stronger materials, and find the best ways to utilize sustainable resources. Structural engineers are involved in every step of the building process. They draw up designs from scratch and collaborate with architects and other kinds of engineers to create buildings that can fulfill their intended use. Structural engineers design the framework of large structures like skyscrapers and bridges to make them capable of supporting their own weight while resisting the forces of weather and traffic. They design specific architectural components like beams, columns, foundations, and floors that need to be structurally sound. They draw on their expertise with various materials to choose the most appropriate materials for each job. Structural engineers often specialize in the types of structures they design and may work on projects ranging from residential homes to nuclear power plants. They also breathe new life into old buildings, renovating or transforming them to serve completely new purposes. In some cases, they inspect old buildings and direct their demolition. If a structure fails, they may be called upon to investigate the cause.

Regardless of the size or scope of the project, their main focus is always on the safety and

feasibility of the design. Although structural engineering is closely associated with the construction of buildings, the professionals are also involved in the design of machinery, medical equipment, and vehicles. Their skills and expertise are needed wherever structural integrity affects functioning and safety. It takes considerable knowledge and skills to do the work of a structural engineer. Because of the safety issues involved, structural engineers are trained to strict standards. Most structural engineers start their careers with a bachelor's degree in civil, mechanical, or aerospace engineering, with specialized courses covering the basic concepts of structural engineering. Although a bachelor's degree is enough to qualify for most entry-level jobs, a master's degree in structural engineering is needed to advance to more senior-level positions. The educational path is intense, but once qualified, new structural engineers become highly sought-after professionals. Engineering projects are in high gear, and opportunities are everywhere. Structural engineering jobs can be found in small consulting firms and large multinational corporations with offices around the world. There are opportunities for travel and working overseas, since the skills needed for structural engineering are the same anywhere in the world. Structural engineering is a hugely satisfying profession with both tangible and intangible rewards. Because the demand is currently exceeding supply, structural engineers are enjoying good pay that continues to get even better. Employers are attracting qualified candidates with signing bonuses and a bucketful of exceptional benefits. There is also a great deal of variety, creative satisfaction, and the chance to help shape a better world. Structural engineers are highly respected for their contributions to society. It is a career you can be proud of.

This book will help you land software engineering jobs in the financial markets industry -

Wallstreet, Hedge Funds, Exchanges, etc. About the Author: I am Dennis Thompson. I built trading systems for more than 10 years in multiple firms spanning investment banks, exchanges, algorithmic trading firms, etc. across multiple asset classes. I have been on both sides of the interview table many times so I could write this guide. Who this book is for: This book is written to help programmers wanting to get into the financial markets/trading industry as trading systems developers into firms operating in algorithmic trading, high-frequency trading, market-making, electronic trading, brokerages, exchanges, hedge funds, investment banks, proprietary trading firms, etc. in various asset classes such as equities, derivatives, FX, bonds, commodities, cryptocurrencies, etc. This book can serve as a quick interview prep guide for developers already working in this space when trying to change jobs. This book will serve programmers who already know C++ or willing to learn C++. Due to the level of performance expected from these systems, most trading systems are developed in C++. You can get into prestigious, high paying wall street tech jobs

like these without any previous industry experience if you can improve your skills in the different areas mentioned in the book. Resources are provided. Practice questions and answers will help you understand the level and type of questions expected in the interview. This is an "Interview Guide ONLY". If you lack some skills required for these jobs, you can study by picking the books/sources provided in the resources section. Who this book is not for: This book is NOT suitable for quant and trader interviews. What does this book contain: Overview of the financial markets trading industry - types of firms, types of engineering jobs, work environment and culture, compensation, how to get job interviews, etc. For every chapter mentioned below, a guideline of what kind of topics are asked in the interviews is mentioned. For every chapter mentioned below, many questions with full solutions/answers are provided that are at similar difficulty as real interviews, that will cover the topics in sufficient breadth and depth. C++ Multithreading Inter-Process Communication Network Programming Lockless Queues Low Latency Programming and Techniques Systems Design Design Patterns Coding Questions Math Puzzles Domain-Specific Tools Domain Knowledge Behavioral Questions Resources - a list of books for in-depth knowledge What does Trading Systems Developer do: They build different components of trading systems such as market data feed handler, matching engine, strategy execution engine, smart order router, signals computation engine, order management system, risk management system, pricing engine, price/volume forecasting engine, implementing trading strategies with help of quants and traders, etc. Due to the competitive nature of the firms operating in this space, low latency, high availability, high performance, handling high volumes of data efficiently, fault tolerance, reliability are the key characteristics of these systems. Upsides of working as Trading Systems Developer: Opportunity to work on cutting edge technologies Opportunity to work with quants, traders and financial engineers will expand your understanding of the financial markets both qualitatively and quantitatively Opportunity to work with other smart engineers as these firms tend to hire engineers with strong engineering caliber Top compensation with big base and bonus, comparable to FAANG companies Compared to general tech interviews, there is an emphasis on some other topics which I will provide in the book. This book will seriously cut down your interview preparation time and gives you a huge advantage in landing the jobs.
