Sample Response: The reactants and

products determine the type of chemical reaction. If there are more products than reactants, then it is a decomposition reaction. If there are more reactants than products, it is a synthesis reaction. If oxygen is a part of the reactant, it is a combustion reaction.

Types of Chemical Reactions. There are five main types of chemical reactions.

These are synthesis, decomposition, combustion, single replacement and double replacement. Synthesis – A reaction where two reactants combine to form 1 product. $\text{A} + \text{B} \rightarrow \text{C}$. $2\text{Na}(\text{s}) + \text{Cl}_2(\text{g}) \rightarrow 2\text{NaCl}(\text{s})$

Decomposition– A reaction where a single reactant separates to form two or more products. $\text{A} \rightarrow \text{B} + \text{C}$

There are many different types of chemical reactions. There are single and double displacement reactions, combustion reactions, decomposition reactions, and synthesis reactions. See if you can identify the type of reaction in this ten question chemical reaction classification practice test. Answers appear after the final question.

Combination Reactions (also called Synthesis Reactions) occur when two or

more substances, elements or compounds, combine to form one new substance. For example, hydrogen and oxygen gases combine to give water:
$$2\text{H}_2(\text{g}) + \text{O}_2(\text{g}) \rightarrow 2\text{H}_2\text{O}(\text{l})$$
 Decomposition Reactions occur when a compound breaks apart to yield two or more new substances. As an example, potassium chlorate decomposes when heated to yield potassium chloride and oxygen gas.
