Environmental Impact Assessment (EIA) is a fast-growing field of land-use planning affecting many disciplines. At present, UK Government legislation requires EIA for certain types of development. Subject to a further new European directive, an EIA will be required for all policies, plans and programmes. Planning and Environmental Impact Assessment in Practice provides a practical introduction to the subject and relates the theory to the practice through extensive use of case studies. Edited by Joe Weston, the book draws on contributions from a number of practising experts in the field and covers topics such as: assessing the need for EIAs; the environmental team; scoping and public participation; internal and external consultation; local lobbying; local authority review and decision-making; public enquiries; monitoring the impacts; pollution control; and the lessons to be learned. Planning and Environmental Impact Assessment in Practice provides a practical introduction to EIA for final year undergraduate and postgraduate MSc courses in planning, geography, civil engineering, building and estate management, and development.

In the shadow of Mount Kenya, surrounded by the forests and creatures of the savannah, life drags interminably for the inmates of POW Camp 354, captured in Africa during World War II. Confined to an endless cycle of boredom and frustration, one prisoner realizes he can bear it no longer. When the clouds covering Mount Kenya part one morning to reveal its towering peaks for the first time, Felice Benuzzi is transfixed. The tedium of camp life is broken by the beginnings of a sudden idea--an outrageous, dangerous, brilliant idea. Not many people would break out of a POW camp and trek for days across perilous terrain before climbing the north face of Mount Kenya with improvised equipment, meager rations, and a picture of the mountain on a tin of beef as their most accurate guide. Fewer still would break back into the camp on their return. This is the remarkable story of three such men--a powerful testament to the human spirit of rebellion and adventure--reissued in a deluxe edition featuring Benuzzi's own watercolor paintings of the expedition and a final chapter that has never before appeared in English.

Although the basic theories of thermodynamics are adequately covered by a number of existing texts, there is little literature that addresses

more advanced topics. In this comprehensive work the author redresses this balance, drawing on his twenty-five years of experience of teaching thermodynamics at undergraduate and postgraduate level, to produce a definitive text to cover thoroughly, advanced syllabuses. The book introduces the basic concepts which apply over the whole range of new technologies, considering: a new approach to cycles, enabling their irreversibility to be taken into account; a detailed study of combustion to show how the chemical energy in a fuel is converted into thermal energy and emissions; an analysis of fuel cells to give an understanding of the direct conversion of chemical energy to electrical power; a detailed study of property relationships to enable more sophisticated analyses to be made of both high and low temperature plant and irreversible thermodynamics, whose principles might hold a key to new ways of efficiently covering energy to power (e.g. solar energy, fuel cells). Worked examples are included in most of the chapters, followed by exercises with solutions. By developing thermodynamics from an explicitly equilibrium perspective, showing how all systems attempt to reach a state of equilibrium, and the effects of these systems when they cannot, the result is an unparalleled insight into the more advanced considerations when converting any form of energy into power, that will prove invaluable to students and professional engineers of all disciplines.

The quality of water is not only a technological and scientific issue, but a social and economic problem, in both developed and developing countries. Besides local regulations, which differ between regions and need constant upgrades, significant scientific developments are required in both the detection and removal of water contaminants. This Issue focuses on some recent advancements in the photocatalytic removal of organic pollutants, which is one of the aspects of the

problem that involves the need of advanced catalysts and implies significant advancements in the field of materials science and chemical engineering.
