Ultimate Analysis Tests. Ultimate analysis tests produce more comprehensive results than the proximate analyses. SGS uses the results from ultimate analysis tests to determine the elemental composition of the coal including moisture, ash, carbon, hydrogen, nitrogen, sulfur, and oxygen (by difference).

FIGURE 7-3. Variation of selected coal properties with coal rank. The chemical approach to characterizing coals is to determine the amounts of the principal chemical elements in them. In the jargon of the coal business, this procedure is called the ultimate analysis of coal. Carbon and hydrogen are the principal combustible elements in coal.

1.1 This practice covers the term ultimate analysis as it is applied to the analysis of coal and coke. The information derived is intended for the general utilization by applicable industries, to provide the basis for evaluation, beneficiation, or for other purposes.

Standard Practice for Ultimate Analysis of Coal and Coke

Ultimate analysis of coal and coke is defined in ASTM D3176 as the determination of the carbon, hydrogen, nitrogen, and sulfur in the material, as found in the gaseous products of its complete combustion, the determination ash in the material as a whole, and the estimation of oxygen by difference. Coal Analysis, Kentucky Geological Survey, University of ...

To determine the sulfur value in ultimate analysis, prior methods of coal cleaning, organic sulfur and inorganic sulfur should be included. Moisture and ash should also be determined because the analytical values of the ultimate analysis should be reported on an appropriate basis (ar, db, daf) (Speight, 2005). The elemental composition of the organic material for coal in ultimate analysis can ...

Ultimate Analysis & Significance of Coal The ultimate analysis determines all coal component elements, solid or gaseous and it needs properly equipped laboratory with skilled chemists. It is useful in determining the quantity of air required for combustion and the volume and composition of the combustion gases.

Proximate analysis, ultimate analysis and calorific value are commonly used to characterise solid biomass fuels. The proximate analysis serves as a simple means for determining the behaviour of a solid biomass fuel when it is heated. It determines the contents of moisture, volatile matter, ash and fixed carbon of the fuel.

The ultimate analysis indicates the various elemental chemical constituents in coal such as carbon, hydrogen, oxygen, sulfur, nitrogen etc. The ultimate analysis is useful in determining the quantity of air required for combustion and volume and composition of combustion gases.
