The objective of ultimate analysis is to determine the amount of carbon (C), hydrogen (H), oxygen (O), sulfur (S), and other elements within the coal sample. The determination of the carbon and hydrogen in the material, as found in the gaseous products of its complete combustion, the determination of sulfur, nitrogen, and ash in the material as a whole, and the estimation of oxygen by difference.

FIGURE 7-3. Variation of selected coal properties with coal rank. The chemical approach to characterizing coals is to determine the amounts of the principal chemical elements in them. In the jargon of the coal business, this procedure is called the ultimate analysis of coal. Carbon and hydrogen are the principal combustible elements in coal.

The ultimate analysis indicates the various elemental chemical constituents in coal such as carbon, hydrogen, oxygen, sulfur, nitrogen etc. The ultimate analysis is useful in determining the quantity of air required for combustion and volume and composition of combustion gases.

What is proximate and ultimate analysis of coal - Answers

Ultimate analysis of coal and coke is defined in ASTM D3176 as the determination of the carbon, hydrogen, nitrogen, and sulfur in the material, as found in the gaseous products of its complete combustion, the determination ash in the material as a whole, and the estimation of oxygen by difference.
