Concepts in the book may be directly applied to laboratory operations. In addition, the book illustrates other approaches to laboratory pollution prevention, such as reducing wastewater discharges and fume hood emissions. A wide range of waste types, including hazardous, infectious, medical, PCB, and radioactive, are discussed. This book helps you to develop a broad, institutional framework to plan and set

priorities for pollution prevention. It responds to your laboratory's critical need to have readily available techniques and concepts for waste minimization and pollution prevention.

Managing Used Motor Oil Elsevier

During the past decade synthetic oils have been introduced into engine test programs in the U.S. Army. These test programs have ranged from evaluation of vehicle fleet operation to engine test development for arctic engine oil specifications. Both performance and physico-chemical properties have been evaluated including the development of analytical schemes to identify lubricant base stock composition. In many respects, routine oil analyses have not been influenced by the nature of a lubricant's base stock (as to whether it is mineral oil or synthetic oil base stock). However, some laboratory tests have been rendered useless while others have been enhanced with respect to their applicability to synthetic-based lubricants as opposed to mineral oil-based lubricants. This report has as its objective to place in perspective the Army's experience primarily with ground vehicle engine lubricants so as to illustrate the impact synthetic and hybrid oil base stocks have had in the analysis of new and used engine oils.

Used lubricating oil is a valuable resource. This book examines recycling processes for a range of products with different properties and different criteria. It also compares the various recycling methods and resulting products to conventional products obtained from original refining processes. The reviews, data, and comparisons provided by the authors allow readers to identify which processes are likely to produce a product with specific properties, and enable them to combine this with an analysis of the economic data to identify attractive oil recycling propositions.

Emergency and Continuous Exposure Guidance Levels for Selected Submarine Contaminants Jones & Bartlett Learning

U.S. Navy personnel who work on submarines are in an enclosed and isolated environment for days or weeks at a time when at sea. To protect workers from potential adverse health effects due to those conditions, the U.S. Navy has established exposure guidance levels for a number of contaminants. In this latest report in a series, the Navy asked the National Research Council (NRC) to review, and develop when necessary, exposure guidance levels for 11 contaminants. The report recommends exposure levels for hydrogen that are lower than current Navy guidelines. For all other contaminants (except for two for which there are insufficient data), recommended levels are similar to or slightly higher than those proposed by the Navy. The report finds that, overall, there is very little exposure data available on the submarine environment and echoes recommendations from earlier NRC reports to expand exposure monitoring in submarines.
