How to Modify Your Nissan and Datsun OHC Engine Franzis Verlag
In the very beginning, the automotive industry was dominated by open-top vehicles whose body shapes were very much based on the horse-drawn carriage, there were open and closed carriages and then there was the Coupe. These were developed from the type of carriage known as the Berlin coach, which was designed as a classic vehicle for individual luxury travel and prestige. This type of carriage offered an intimate atmosphere focused exclusively on the passengers; it did not even have space for luggage, it simply exuded style, elegance and luxury in every way. This first volume of the Mercedes-Benz Coupe book addresses the journey from what was a functional sports car design to what has become the incomparable Mercedes-Benz 'Sports Coupe'; its timeless body design has remained, even today both a dream car and a dream Coupe to anyone whom aspires to follow in the footsteps of the early individualists who chose style and elegance over practicality. With over 300 photographs and illustrations, this book includes: an overview of the early days of 'Sports-Car' design; the influences of aerodynamics on

design evolution; early protagonists at Daimler-Benz and how they influenced design of the Coupe shape; how the Racing Coupe influenced what became the production Sport Coupe; the experimental and one-off prototypes, and finally the continuation of the Super Sport Light concept through the 'S-Class' range.

In 1988, IARC classified diesel exhaust as probably carcinogenic to humans (Group 2A). An Advisory

Group which reviews and recommends future priorities for the IARC Monographs Program had recommended diesel exhaust as a high priority for re-evaluation since 1998. There has been mounting concern about the cancer-causing potential of diesel exhaust, particularly based on findings in epidemiological studies of workers exposed in various settings. This was re-emphasized by the publication in March 2012 of the results of a large US National Cancer Institute/National Institute for Occupational Safety and Health study of occupational exposure to such emissions in underground miners, which showed an increased risk of death from lung cancer in exposed workers. The scientific evidence was reviewed thoroughly by the Working Group and overall it was concluded that there was sufficient evidence in humans for the carcinogenicity of diesel exhaust. The Working Group found that diesel exhaust is a cause of lung cancer (sufficient evidence) and also noted a positive association (limited evidence) with an increased risk of bladder cancer (Group 1). The Working Group concluded that gasoline exhaust was possibly carcinogenic to humans (Group 2B), a finding unchanged from the previous evaluation in 1989.
