_____ ‘This book will make you think... it will frighten you, and it will shock you... Frankly I could not read it at night.’ – Ann Rule, author of *The Stranger Beside Me: The Inside Story of Serial Killer Ted Bundy* HOW DO YOU CATCH A SERIAL KILLER? Interpreting the calling cards of the serial murderer, Robert Keppel reveals the answers hidden among the grisly evidence, the common threads that link each devastating act of brutal violence. Explore in unflinching detail the monstrous patterns, sadistic compulsions and depraved motives of the

killer, and why they kill again and again.

Signature Killers is the ultimate insight into the mind of the serial killer. From *The Lonely Hearts Killer* who haunted the most desperate of women in 1950s America, to the infamous symbols of evil as Jeffrey Dahmer, Ted Bundy and John Gacy, these are the cases – horrifying, graphic and unforgettable – that shed light on the darkest corners of the pathological mind. Fundamentals of Noise and Vibration is based on the first semester of the postgraduate Masters' course in Sound and Vibration Studies at the Institute of Sound and Vibration Research, at the University of Southampton. The main objective of the course is to provide students with the skills and knowledge required to practise in the field of noise and

vibration control technology. Readers do not need prior formal training in acoustics although a basic understanding of mechanics, fluid dynamics and applied mathematics is required. Many of the chapters use examples of models and forms of analysis to illustrate the principles that they introduce. By pointing toward the practical application of these fundamental principles and methods, the book will benefit those wishing to extend their knowledge and understanding of acoustic and vibration technology for professional purposes. Advanced Applications in Acoustics, Noise and Vibration serves as a companion volume.

Profiling has been acknowledged as a major contribution to the treatment of language disorder. First developed with reference to grammatical disability, profiling is extended in this book to cover segmental phonology, prosody and semantics. The book also includes a revised version of the grammatical profiling procedure, LARSP. For this second edition of the book all the existing material has been updated. In addition there is a new chapter, entitled "Putting Profiles into Practice," which contains extracts from case

studies and several guidelines for teaching and therapy.

This new, fully illustrated catalogue on the celebrated progenitor of video art, Nam June Paik (1932-2006), brings together a host of scholars, artists, and Paik's own collaborators to illuminate the work of this innovative artist. An essay by curator Michelle Yun takes readers through Paik's highly original career, providing insight into his radical and

witty experiments with technology, especially in relation to the body, which he viewed as vital platforms for the future of art, science, and popular culture. Scholars David Joselit and John Maeda contribute texts examining the artist's interest in new media and popular culture. A roundtable discussion with three of Paik's own artistic collaborators and contemporary artists' statements shed light on the collaborative process and Paik's enduring influence on artistic practice today. Drawing on the newly

The importance of learning
mathematics is constantly stressed
by educationalists and employers

alike. Yet survey after survey
shows that large numbers of
children leave school lacking both
competence and interest in
mathematics. What is going wrong
and what should be done about it?
In *Children and Number* Martin
Hughes proposes a new perspective
on children's early attempts to
understand mathematics. He
describes the surprisingly
substantial knowledge about number
which children acquire naturally
before they start school, and
contrasts this with the
difficulties presented by the
formal written symbolism of
mathematics in the classroom. He
argues that children need to build
links between their informal and
their formal understanding of

as to the mechanism for high temperature superconductivity, in the context of a world undergoing major changes in its political alignments and sense of the possibility for the future. It was characterized by generosity in the sharing of our uncertainties and speculations, as was appropriate for both the subject matter and the context. The workshop was organized, of necessity around the experimental work, as is this volume. Where the theoretical work is directly relevant to particular experiments, it is included in the appropriate sections with them. Most of the participants felt strongly that magnetic fluctuations played an important role in the mechanism for high T_c , although with the exception of the ILS R work reported by Luke showing results inconsistent with the anyon picture, and the work on flux phases by Lederer, the mechanism remained an issue in the background. A major focus was the phenomenological interpretation of the NMR data.

Despite an extensive literature on homelessness there is surprisingly little work that investigates the roots of homelessness by tracking homeless people over time. In this fascinating and much-needed ethnographic study, Megan Ravenhill presents the results of ten years' research on the streets and in the hostels and day-centres

of the UK, incorporating intensive interviews with 150 homeless and formerly homeless people as well as policy makers and professionals working with homeless people. Ravenhill discusses the biographical, structural and behavioural factors that lead to homelessness. Amongst the important and unique features of the study are: the use of life-route maps showing the circumstances and decisions that lead to homelessness, a systematic study of the timescales involved, and a survey of people's exit routes from homelessness. Ravenhill also identifies factors that predict those most vulnerable to homelessness and factors that prevent or considerably delay the

onset of homelessness.

This book examines holomorphic Morse inequalities and the asymptotic expansion of the Bergman kernel on manifolds by

using the heat kernel. It opens perspectives on several active areas of research in complex, Kähler and symplectic geometry. A large number of applications are also included, such as an analytic proof of Kodaira's embedding theorem, a solution of the Grauert-Riemenschneider and Shiffman conjectures, compactification of complete Kähler manifolds of pinched negative curvature, Berezin-Toeplitz quantization, weak Lefschetz theorems, and asymptotics of the Ray-Singer analytic torsion.

Amphiphilic layers play essential roles in the

behaviour of a great variety of disperse systems such as micelles, microemulsions and vesicles. They can also exist as isolated mono- or bilayers, or constitute extended liquid crystalline structures.

Although the properties of these different systems may at first sight seem unrelated, theoretical interpretations of them depend on several common concepts. This was the reason for bringing together scientists working in this area for the International Winter School on the Physics of Amphiphilic Layers, which

was held at Les Houches, 10-18 February, 1987. The topics treated in the proceedings volume are mono- and bilayers, interactive forces between layers (with special emphasis on steric forces), ordered structures (in particular swollen lamellar phases and defects), vesicles, micelles (including polymer-like systems), microemulsions (especially random bicontinuous structures) and porous media. The importance of thermal fluctuations in the amphiphilic layers is stressed. Recent results are presented and literature references allow readers not familiar with the subject to find any background information they require.
