Evolutionary Neuroscience is a collection of articles in brain evolution selected from the recent comprehensive reference, *Evolution of Nervous Systems* (Elsevier, Academic Press, 2007). The selected chapters cover a broad range of topics from historical theory to the most recent deductions from comparative studies of brains. The articles are organized in sections focused on theories and brain scaling, the evolution of brains from early vertebrates to present-day fishes, amphibians, reptiles and birds, the evolution of mammalian brains, and the evolution of primate brains, including human brains. Each chapter is written by a leader or leaders in the field, and has been reviewed by other experts. Specific topics include brain character reconstruction, principles of brain scaling, basic features of vertebrate brains, the evolution of the major sensory systems, and other parts of brains, what we can learn from fossils, the origin of neocortex, and the evolution of specializations of human brains. The collection of articles will be interesting to anyone who is curious about how brains evolved from the simpler nervous systems of the first vertebrates into the many different complex forms now found in present-day vertebrates. This book would be of use to students at the graduate or undergraduate levels, as well as professional neuroscientists, cognitive scientists, and psychologists. Together, the chapters provide a comprehensive list of further reading and references for those who want to inquire further. • The most comprehensive, authoritative and up-to-date single volume collection on brain evolution • Full color throughout, with many illustrations • Written by leading scholars and experts

Annotation Derek T. O'Hagan and a team of expert vaccinologists and pharmacologists thoroughly describe the preparation, characterization, and evaluation of a wide range of alternative vaccine adjuvants for use in preclinical studies. Each chapter carefully reviews a single adjuvant, and suggests why a specific adjuvant might be preferred for a given antigen, depending on what type of immune response is desired. Alternate adjuvant choices are also presented so that researchers can choose those most efficacious for their specific purpose. Comprehensive and highly practical, *Vaccine Adjuvants: Preparation Methods and Research Protocols* provides an effective guide to making and using vaccine adjuvants. By closely following directions from the book, today's researchers will be able optimally to induce specific immune responses against different types of antigens and to selectively manipulate the immune response in a favorable way.

Rapid advances in our understanding of basic cell biological processes and of the molecular mechanisms of cell function and dysfunction have led to an increasing interest in utilizing these approaches in neurobiological research. Efforts in the most rapidly advancing areas are multidisciplinary and the o- come of contributions from many investigators employing a variety of te- niques to address a specific problem. Although a strong basis in fundamental neurobiological concepts is essential for each researcher, the ability to apply new techniques and approaches to the examination of both cellular and molecular processes requires knowledge of a wide variety of methodologies. The objective of *Neurodegeneration Methods and Protocols* is to develop an understanding, appreciation, and technical ability in various cellular and molecular techniques for studying many aspects of nervous system cell bi- ogy. The protocols in this volume span a multidisciplinary range of cellular and molecular approaches, and should allow investigators to address research questions directed toward understanding nervous system function, injury, degeneration, and the repair/regenerative process.
