"This book is a comprehensive guidebook of therapeutic de-escalation techniques for nurses and other healthcare professionals to improve safety in healthcare facilities. Readers will explore the concepts of aggression (including risk factors), de-escalation, and therapeutic communication. They will also learn how to perform mental status assessments, manage and even prevent aggressive behavior, and practice conflict resolution, and--when faced with individuals with depressive disorders, suicidal ideation, and/or self-injurious behavior (SIB)--engage in crisis intervention. Specific therapeutic interventions for difficult behavioral issues associated with schizophrenia, dementia, bipolar disorder, cognitive impairment, anxiety and panic disorders are also covered, as are stress-management techniques to help patients cope, tips for creating a caring and healing environment to stop violence before it starts, and a framework for building a healthcare violence prevention program. Nursing students and healthcare professionals of all educational levels will find this book to be immensely valuable. De-escalation is one of the most valuable skills a healthcare worker can possess. Indeed, all healthcare workers need this vital skill to help ensure their safety in the healthcare environment. It's not uncommon for healthcare professionals to encounter an agitated or aggressive person. How that healthcare worker responds will dictate

whether the situation is defused or escalated--perhaps even resulting in physical violence. The goal of this book is to ensure the result is the former--to prevent healthcare violence, and to foster a safe healthcare workplace that benefits all and promotes peace and safety for everyone"--

In 1690, Christiaan Huygens (1629-1695) published *Traité de la Lumière*, containing his renowned wave theory of light. It is considered a landmark in seventeenth-century science, for the way Huygens mathematized the corpuscular nature of light and his probabilistic conception of natural knowledge. This book discusses the development of Huygens' wave theory, reconstructing the winding road that eventually led to *Traité de la Lumière*. For the first time, the full range of manuscript sources is taken into account. In addition, the development of Huygens' thinking on the nature of light is put in the context of his optics as a whole, which was dominated by his lifelong pursuit of theoretical and practical dioptrics. In so doing, this book offers the first account of the development of Huygens' mathematical analysis of lenses and telescopes and its significance for the origin of the wave theory of light. As Huygens applied his mathematical proficiency to practical issues pertaining to telescopes -- including trying to design a perfect telescope by means of mathematical theory -- his dioptrics is significant for our understanding of seventeenth-century relations between theory and practice. With this full account of Huygens' optics, this book sheds new light on the history of seventeenth-century optics and the rise of the new mathematical sciences, as well as Huygens' oeuvre as a whole. Students of the history of optics, of early mathematical physics, and the Scientific Revolution, will find this book enlightening.

Thermofluids, while a relatively modern term, is applied to the well-established field of thermal sciences, which is comprised of various intertwined disciplines. Thus mass, momentum, and heat transfer constitute the fundamentals of thermofluids. This book discusses thermofluids in the context of thermodynamics, single- and two-phase flow, as well as heat transfer associated with single- and two-phase flows. Traditionally, the field of thermal sciences is taught in universities by requiring students to study engineering thermodynamics, fluid mechanics, and heat transfer, in that order. In graduate school, these topics are discussed at more advanced levels. In recent years, however, there have been attempts to integrate these topics

through a unified approach. This approach makes sense as thermal design of widely varied systems ranging from hair dryers to semiconductor chips to jet engines to nuclear power plants is based on the conservation equations of mass, momentum, angular momentum, energy, and the second law of thermodynamics. While integrating these topics has recently gained popularity, it is hardly a new approach. For example, Bird, Stewart, and Lightfoot in Transport Phenomena, Rohsenow and Choi in Heat, Mass, and Momentum Transfer, El-Wakil, in Nuclear Heat Transport, and Todreas and Kazimi in Nuclear Systems have pursued a similar approach. These books, however, have been designed for advanced graduate level courses. More recently, undergraduate books using an integral approach are appearing.
