"Introduction to Computer Programming with Visual Basic 6: A Problem-Solving Approach" is written for students with little or no programming experience. This comprehensive text equips students with

the skills necessary to develop computer applications in any language by helping them develop a framework for creating programs. Each chapter illustrates the application of this framework from Step 1 (Analysis) to Step 6 (Completing the Documentation) through a programming case study. The authors emphasize the program development life cycle and fundamental programming concepts such as data types, loops, decisions, and arrays. FEATURES To further highlight the authors' emphasis on programming concepts instead of GUI elements, a limited number of program controls are used in the examples. To provide greater flexibility to instructors, more GUI elements are included in Appendix A, "Visual Basic User Interface Objects." The preface and the

Instructor's Resource Manual provide teaching tips on how to incorporate the controls presented in Appendix A in lab exercises or projects Object-Event Diagrams are introduced in Chapter 1 to help students understand the importance of events Two chapters on database programming (Chapter 10 and 11) offer students the skills needed to develop more robust database applications Chapter 12 is devoted to fundamental object-oriented programming concepts and techniques for developing object-oriented programs in Visual Basic to reinforce this new standard for developing software The authors offer outstanding pedagogical aids such as common examples that build on previous concepts, a multitude of end-of-chapter short answer and programming exercises,

and plenty of programming projects

Book Those who have little or no programming experience or who might be picking up Visual Basic as a second language. Bug Alert Description: Changing the startup form's name in a VB WinForms app does not update the "Startup form" #4517 Explanation: In the latest Visual Basic update on GitHub, Microsoft accidentally introduced a significant bug that you should be aware of. In the Visual Basic project properties dialog on one of the tabs (Application), is a drop down box for selecting the "startup object". This can be either a Main method or a System.Windows.Forms instance (or System.Windows.Window for WPF). When you do a rename on a form (say from the code editor in source or from the solution explorer) currently set as the startup form the rename doesn't cascade to the startup object project property cause the project to enter an invalid state where the user must now manually reset this project property from the now nonexistent Form to the new name. This is a huge annoyance. The fix for the bug (until Microsoft addresses) can be found here: http://www.jamesfoxall.com/teach-visual-basic-2015-errata/
