In spite of all the assistance offered by electronic control systems, the latest generation of passenger car chassis still relies on conventional chassis elements. With a view towards driving dynamics, this book examines these conventional elements and their interaction with mechatronic systems. First, it describes the fundamentals and design of the chassis and goes on to examine driving dynamics with a particularly practical focus. This is followed by a detailed description and explanation of the modern components. A separate section is devoted to the axles and processes for axle development. With its revised illustrations and several updates in the text and list of references, this new edition already includes a number of improvements over the first edition.

This book provides insight into the topic of place and territorial identity, which involves both the dimension of collective belonging and the politics of territorial planning and enhancement. It considers the social, economic and political effects of territorial identity representations among others in terms of mystification, spatial fetishism, and the creation of place and territorial stereotypes. A mixed methodology is employed to research case studies at diverse territorial scales which are relevant to the impact of a variety of factors on place/territorial identity processes such as migration, political and economic changes, natural disasters, land use changes, etc. Visual imagery, constructing visual discourses and living within visual cultures are placed in the foreground and refer to among others the changes and challenges introduced by the Internet and social networks in place/territory representations and self-representations; identity politics and its impact on place/territorial identity representations; discourses in shaping representations and self-representations of territorial/place-based identities related to collective memory, cultural heritage, invented tradition, imagined communities and other key notions.

This book presents fundamental concepts and general approaches to City Logistics. City Logistics is the process of totally optimising urban logistics activities by considering the social, environmental, economic, financial and energy impacts of urban freight movement. City Logistics initiatives are required to solve urban

freight transport problems including high levels of traffic congestion, negative environmental impacts, high energy consumption and a shortage of labour. The focus of this work is on modelling City Logistics. Modelling is of crucial importance, since estimates of the impacts generated by City Logistics measures are required for evaluating them. It highlights the formulation of mathematical models of vehicle routing and scheduling with Intelligent Transport Systems (ITS), optimal terminal locations and impact estimation by City Logistics measures. Heuristics techniques such as genetic algorithms, simulated annealing and tabu search are also given to identify approximate optimal solution of these combinatorial optimisation problems. ITS provides powerful tools for efficiently managing and operating vehicle fleets. Sophisticated logistics systems can now be developed by integrating Global Positioning Systems (GPS) and Geographical Information Systems (GIS) in conjunction with application software. In this context, the book presents a theoretical and practical treatment of modelling City Logistics based on ITS.
