Automotive Engineering Medium/Heavy Duty Truck Engines, Fuel & Computerized Management Systems Diagnostics, or fault finding, is a fundamental part of an automotive technician's work, and as automotive systems become increasingly complex there is a greater need for good diagnostic skills. Advanced Automotive Fault Diagnosis is the only book to treat automotive diagnostics as a science rather than a check-list procedure. Each chapter includes basic principles and examples of a vehicle system followed by the appropriate diagnostic techniques, complete with useful diagrams, flow charts, case studies and self-assessment questions. The book will help new students develop diagnostic skills and help experienced technicians improve even further. This new edition is fully updated to the latest technological developments. Two new chapters have been added – On-board diagnostics and Oscilloscope diagnostics – and the coverage has been matched to the latest curricula of motor vehicle qualifications, including: IMI and C&G Technical Certificates and NVQs; Level 4 diagnostic units; BTEC National and Higher National qualifications from Edexcel; International Motor Vehicle qualifications such as C&G 3905; and ASE certification in the USA.

"As a reference book it has to be classed as one of the best! There should be a copy of it in every college library." Association of Motor Vehicle Teachers' Newsletter The Motor Vehicle has been an essential reference work for both the student and practising engineer ever since the first edition appeared in 1929. Today it is as indispensable to anyone with a serious interest in vehicle design techniques, systems and construction as it was then. The current edition has undergone a major revision to include seven new chapters. These include Electric Propulsion; covering all aspects from lead acid and alternative batteries to fuel cells and hybrid vehicles, Static and Dynamic Safety, and Wheels and Tyres. The chapter on the compression ignition engine has been expanded to form three chapters, concentrating on aspects such as common rail injection, recently developed distributor type pumps and electronic control of injection. Automatic, semi-automatic and continuously variable ratio transmissions are covered in two new chapters. A third contains information on the latest developments in computer-aided control over both braking and traction, for improving vehicle stability, while another contains entirely new information on the practice and principles of electrically-actuated power-assisted steering. Also included is coverage of material detailing the latest knowledge and practice relating to safety systems, vehicle integrity, braking systems and much more. The established layout of the book is retained, with topics relating to the Engine, Transmission and Carriage Unit dealt with in turn. Each chapter is well-provided with diagrams, sections, schematics and photographs, all of which contribute to a clear and concise exposition of the material under discussion. Latest extensive revisions to a well-established title New chapters on electric

propulsion and vehicle safety.

This work is part of a multiyear program to foster the development, evaluation, and deployment of forward crash avoidance systems. The work performed during the first two years of this program addressed adaptive cruise control and warnings based upon the motion and proximity of preceding vehicles in the path of travel. The research work done in the first and second years has provided a foundation for the work performed in this third year. The technology-related work for the third year was focused upon the addition of braking to an UMRI prototype of an ACC system. The objective of this work is to provide test results and system-development experience showing the engineering and human factors issues posed by braking as a supplement to ACC or within a medium-deceleration crash avoidance function. The results indicated that the acceleration level used in increasing the speed of the ACC vehicle was not satisfactory in the opinion of most of the test drivers. Drivers did not want to slow down too much because they were concerned with how long it would take to get back up to the desired speed and headway time gap. They indicated that the resume rate of the system was the system's weakness. With regard to the buzzer that was used to warn the driver when the system was asking for the maximum deceleration authority, there were some drivers who did not like buzzers in general and some drivers who thought the features of this buzzer could be improved. The ratings concerning the deceleration level, the following control, and the system's smoothness were quite good. It is recommended that a simple rule for modulating the throttle should be used to achieve the basic ACC functionality. Braking

should be applied in a progressively increasing manner, and it should be used to adjust vehicle deceleration in a way that will lead to headway time and distance gaps such that throttle modulation can control headway. Every effort should be made to improve the forward-acceleration capability of the vehicle when it is under ACC control. The warning system should have a nonaggressive signal to inform the driver when braking at the full-deceleration authority of the ACC system has been reached. Further consideration should be given to adding another, more aggressive, signal to warn the driver when the deceleration needed to barely avoid a crash exceeds the control authority of the ACC system.
