Pounder's Marine Diesel Engines and Gas Turbines, Tenth Edition, gives engineering cadets, marine engineers, ship operators and managers insights into currently available engines and auxiliary equipment and trends for the future. This new edition introduces new engine models that will be most commonly installed in ships over the next decade, as well as the latest legislation and pollutant emissions procedures. Since publication of the last edition in 2009, a number of emission control areas (ECAs) have been established by the International Maritime Organization (IMO) in which exhaust emissions are subject to even more stringent controls. In addition, there are now rules that affect new ships and their emission of CO<sub>2</sub> measured as a product of cargo carried. - Provides the latest emission control technologies, such as SCR and water scrubbers - Contains complete updates of legislation and pollutant emission procedures - Includes the latest

emission control technologies and expands upon remote monitoring and control of engines

Cruising the Queensland Coast is a cruising guide for yachts cruising the Queensland coast. Each of the 13 coasts, from the Gold Coast to the Cooktown Coast, is covered in detail, including marinas, anchorages, passages, wind and wave averages, public pontoons and quick reference information and links for vital weather, search and rescue, notices to mariners and other vital information. It features hundreds of chartlets and high-resolution aerial photos of anchorages to take the guesswork out of anchoring. Each anchorage has information on depth, bottom, mobile reception, marine park zone and recommended wind directions and strengths. The book is also integrated with Navionics and C-Map. Anchorages and passages can be imported into Navionics and C-Map via GPX link ? icons throughout the book. The book also provides an extensive reference of useful information for the Queensland Coast such as skills and experience, recommended apps, charts and books, equipping the yacht for cruising, cruising logistics, climate and weather systems, marine hazards and the three major

marine parks and their rules. This book will help get the first-time cruiser of the Queensland coast started. For those familiar with the coast, the wealth of information, data and links all pulled together into one place and organised in a systematic way will prove invaluable. For both, the more than one thousand external reference links make it easier to cruise the coast safely and simplify many of the everyday tasks of living on a cruising yacht such as finding and entering a marina and restocking once there.

This all new edition is a totally updated cruising guide covering the entire Pacific coast of Mexico from The US Border, down the Baja Peninsula, around up into the Sea of Cortez all the way north to San Felipe, across to Puerto Penasco and south to Puerto Madero/Chiapas. There are 61 additional charts with extensive coverage of the Sea of Cortez, including Topolobampo and Altata on the mainland coast. The charts have valuable information on entrances, dinghy landings, marinas, dangers, ferry routes, anchorages, shore attractions and amenities, and GPS waypoints, to name a few. The introduction and appendices cover everything from entrance requirements, to sun protection, bug screens, radio frequencies, Spanish vocabulary, what to have onboard, fishing, how to deal with pets in paradise, and much more. And don't forget the QR codes, which are linked to videos, websites, marinas, city maps, and even whale watching information!

The use of lubricants began in ancient times and has developed into a major international business

through the need to lubricate machines of increasing complexity. The impetus for lubricant development has arisen from need, so lubricating practice has preceded an understanding of the scientific principles. This is not surprising as the scientific basis of the technology is, by nature, highly complex and interdisciplinary. However, we believe that the understanding of lubricant phenomena will continue to be developed at a molecular level to meet future challenges. These challenges will include the control of emissions from internal combustion engines, the reduction of friction and wear in and continuing improvements to lubricant performance and machinery, life-time. More recently, there has been an increased understanding of the chemical aspects of lubrication, which has complemented the knowledge and understanding gained through studies dealing with physics and engineering. This book aims to bring together this chemical information and present it in a practical way. It is written by chemists who are authorities in the various specialisations within the lubricating industry, and is intended to be of interest to chemists who may already be working in the lubricating industry or in academia, and who are seeking a chemist's view of lubrication. It will also be of benefit to engineers and technologists familiar with the industry who require a more fundamental understanding of lubricants.

This textbook treats Hydro- and Fluid

Dynamics, the engineering science dealing with forces and energies generated by fluids in motion, playing a vital role in everyday life. Practical examples include the flow motion in the kitchen sink, the exhaust fan above the stove, and the air conditioning system in our home. When driving a car, the air flow around the vehicle body induces some drag which increases with the square of the car speed and contributes to excess fuel consumption. Engineering applications encompass fluid transport in pipes and canals, energy generation, environmental processes and transportation (cars, ships, aircrafts). This book deals with the topic of applied hydrodynamics. The lecture material is grouped into two complementary sections: ideal fluid flow and real fluid flow. The former deals with two- and possibly three-dimensional fluid motions that are not subject to boundary friction effects, while the latter considers the flow regions affected by boundary friction and turbulent shear. The lecture material is designed as an intermediate course in fluid dynamics for senior undergraduate and postgraduate students in Civil, Environmental, Hydraulic and Mechanical Engineering. It is supported by notes, applications, remarks and discussions in each chapter. Moreover a series of appendices is added, while some major homework

assignments are developed at the end of the book, before the bibliographic references.

This book shows how the systems approach is employed by scientists in various countries to solve specific problems concerning railway transport. In particular, the book describes the experiences of scientists from Romania, Germany, the Czech Republic, the UK, Russia, Ukraine, Lithuania and Poland. For many of these countries there is a problem with the historical differences between the railways. In particular, there are railways with different rail gauges, with different signaling and communication systems, with different energy supplies and, finally, with different political systems, which are reflected in the different approaches to the management of railway economies. The book's content is divided into two main parts, the first of which provides a systematic analysis of individual means of providing and maintaining rail transport. In turn, the second part addresses infrastructure and

management development, with particular attention to security issues. Though primarily written for professionals involved in various problems concerning railway transport, the book will also benefit manufacturers, railway technical staff, managers, and students with transport specialties, as well as a wide range of readers interested in learning more about the current state of transport in different countries.

Skene's is one of the most famous books on yacht design ever written. First published in 1904, Skene did several revisions, the last of which was published in 1938 and reprinted here in its original form. In 1962, the book was completely revised by Francis S. Kinney and re-published as Skene's *Elements of Yacht Design*. Kinney's last version was in 1973 and it is long out of print. While the experts are divided on the relative merits of the different editions, it appears that there is strong demand for Skene's original work. At last the book is again available to the many boatbuilders, aspiring naval architects and sailors who need it

for frequent reference. The index has been completely revised and expanded to make it more useful for today's readers. "This book is intended to be a practical and concise presentation of some of the operations involved in designing yachts of all types. Cumbersome and impractical methods which are so often found in more pretentious works on naval architecture have been avoided. Those presented have been in everyday use by the author." Thus wrote Norman L. Skene in the preface to the fifth edition of *Elements of Yacht Design*.

Fiction. Latino/Latina Studies. Inside the great landfill at Ro Azul, nica and her friends, her family, society's cast-offs, struggle to survive on what those in the city throw away. This story of the "divers" (buzos), the community of Western untouchables who live in landfills and dumps, immediately made Fernando Contreras Castro famous in his native Costa Rica and around Latin America. Now available in English for the first time in Elaine S. Brooks' translation, NICA LOOKING AT THE SEA tells the story of an underclass invisible to the urban bourgeoisie who produce the trash they eke out a living from, a story no less pertinent in the US and the rest of the English-speaking world than it is in Latin America.
