The first in a series of highly practical, hands on, step-by-step photographic manuals, *Replacing Your Boat's Engine* fills a gap in the market for the DIY boat builder and repairer. It is a subject covered only in piecemeal fashion by the yachting press, which, like general boat repair manuals, can't go into the level of detail Mike Westin does. This is a visual, hand-holding guide, dwelling on the practical details of replacing a boat's engine and related systems as it explains each procedure rather than focussing on the theory (which is relegated to an appendix, for those who wish to go further). Anyone who wishes to upgrade their boat's engine or replace an ailing or broken engine will find this step-by-step illustrated book a hand-holding godsend.

A light-hearted nautical detective story of a seventeen-ton lead keel loaded with six kilos of weapons-grade plutonium (enough for a sizeable nuclear explosion) wandering around the Riviera. Searching for it are its owner, a millionaire who wants to make a killing by selling it to the Middle East's highest bidder, a former racing skipper, his teenage son, and a tall, blonde Swedish policewoman who can dive, punch hard and shoot straight. Mix into this Proven ç al Bouillabaisse the Corsican Mafia, an underwater hijacking, a pink-painted racing yacht advertising a non-existent beer, and a murderous off-shore shoot-out, and you have the menu for a good weekend read.

Air Lubrication and Air Cavity Technology is a major development that has emerged in recent years as a means to reduce resistance and powering for many types of ships, and an efficient design for high speed marine vessels. This book introduces the mechanisms for boundary layer drag reduction and concepts studied in early research work. Air bubble and sheet lubrication for displacement vessels is outlined and the key projects introduced. Generation of low volume flow air cavities under the hull of displacement, semi displacement and planing vessels are introduced together with theoretical and empirical analysis and design methods.

Resistance reduction, power reduction and fuel efficiency are covered for both displacement and high speed vessels. Air layer and air cavity effects on vessel static and dynamic stability are covered, linked to regulatory requirements such as IMO. Seaway motions and reduced impact load of high speed craft in waves are discussed including model test results. Integration of propulsion systems for optimum powering is summarized. A design proposal for a wave piercing air cavity craft is included in an appendix. A comprehensive listing of document resources and internet locations is provided for further research.
