To extract maximum performance, an engine needs an efficient, well-designed, and properly tuned exhaust system. In fact, the exhaust system's design, components, and materials have a large impact on the overall performance of the engine. Engine builders and car owners need to carefully consider the exhaust layout, select the parts, and fabricate the exhaust system that delivers the best performance for car and particular application. Master engine builder and award-winning writer Mike Mavrigian explains exhaust system principles, function, and components in clear and concise language. He then details how to design, fabricate, and fit exhaust systems to classic street cars as well as for special and racing applications. Air/exhaust-gas flow dynamics and exhaust system design are explained. Cam duration and overlap are also analyzed to determine how an engine breathes in air/fuel, as the exhaust must efficiently manage this burned mixture. Pipe bending is a science as well as art and you're shown how to effectively crush and mandrel bend exhaust pipe to fit your header/manifold and chassis combination. Header tube diameter and length is taken into account, as well as the most efficient catalytic converters and resonators for achieving your performance goals. In addition, Mavrigian covers the special exhaust system requirements for supercharged and turbocharged systems. When building a high-performance engine, you need a high-performance exhaust system that's tuned and fitted to that engine so you can realize maximum performance. This comprehensive book is your guide to achieving ultimate exhaust system performance. It shows you how to fabricate a system for custom applications and to fit the correct prefabricated system to your car. No other book on the market is solely dedicated to fabricating and fitting an exhaust system in high-performance applications.

The Toyota Production System is the benchmark used throughout the world for "lean" thinking. Now you can model your own processes after those of the company that "wrote the book on supply chain management." Written by two experts on the subject, along with a former Toyota senior executive, this book details the most celebrated supply chain operation in the world to help you form an integrated, synchronized system that will be the envy of your industry. You will find key insight into the logic behind every point of Toyota's supply chain, along with both the tactics and strategies you can use to build an outstanding system of your own. Toyota Supply Chain Management explains how to achieve balance and efficiency

by focusing on: Variety: Determine your variety of offerings based on operational efficiency and market demand Velocity: Maintain a steady flow through all processes of the supply chain Variability: Manage inconsistencies carefully to reduce cost and improve quality Visibility: Ensure the transparency of all processes to enable continuous learning and improvement The authors provide valuable insider tips and offer hands-on guidance for improving production and operations in a variety of industries, including health care, insurance, banking, credit processing, and retailing. With careful attention paid to every aspect of the subject—from principles and theories to operations and best practices—Toyota Supply Chain Management is the most comprehensive, insightful guide to forging a world-class supply chain system.

These Proceedings contain the papers and oral discussions presented at the Symposium on AERODYNAMIC DRAG MECHANISMS of Bluff Bodies and Road Vehicles held at the General Motors Research Laboratories in Warren, Michigan, on September 27 and 28, 1976. This international, invitational Symposium was the twentieth in an annual series, each one having been in a different technical discipline. The Symposia provide a forum for areas of science and technology that are of timely interest to the Research Laboratories as well as the technical community at large, and in which personnel of the Laboratories are actively involved. The Symposia furnish an opportunity for the exchange of ideas and current knowledge between participating research specialists from educational, industrial and governmental institutions and serve to stimulate future research activity. The present world-wide energy situation makes it highly desirable to reduce the force required to move road vehicles through the atmosphere. A significant amount of the total energy consumed for transportation is expended in overcoming the aerodynamic resistance to motion of these vehicles. Reductions in this aerodynamic drag can therefore have a large impact on ground transportation energy requirements. Although aerodynamic development work on road vehicles has been performed for many years, it has not been widely reported or accompanied by much basic research.

Thorium energy can help check CO2 and global warming, cut deadly air pollution, provide inexhaustible energy, and increase human prosperity. Our world is beset by global warming, pollution, resource conflicts, and energy poverty. Millions die from coal plant emissions. We war over mideast oil. Food supplies from sea and land are threatened. Developing nations' growth exacerbates the crises. Few nations will adopt carbon taxes or energy policies against their economic self-interests to reduce global CO2 emissions. Energy cheaper than coal will dissuade all nations from burning coal. Innovative thorium energy uses economic persuasion to end the pollution, to provide energy and prosperity to developing nations, and to create energy security for all people for all time. "This book presents a lucid explanation of the workings of thorium-based reactors. It is must reading for anyone interested in our energy future." Leon Cooper, Brown University physicist and 1972 Nobel laureate for superconductivity "As our energy future is essential I can strongly recommend the book for everybody interested in this most significant topic." George Olah, 1994 Nobel laureate for carbon chemistry

Quarrying Opencast and Alluvial Mining Naval Inst Press

Quarrying and all other branches of surface mining rather than diminishing in importance have become of more and more consequence economically, industrially and particularly with the depletion of high-grade deep-mined mineral reserves. Low-grade minerals require low cost extraction and this in many cases necessitates very expensive mechanized equipment with the cost of individual units running into millions of pounds in the case of large scale operations with high productivity. There has been, and there still is, a tendency for the smaller single quarries to be amalgamated into groups with large financial resources and therefore with the ability to purchase these expensive machines so necessary to make operations viable. This in turn requires wider administrative and technical knowledge in executives of these groups and as these often handle a wide range of products from widely differing systems of working, this technical knowledge should embrace the exploitation of many different types of deposits. There is, at present, a great dearth throughout the world of such qualified executives as is apparent from advertisements of vacancies in the technical press. It would appear that these industries offer an attractive career to the widely qualified and experienced technologist in these fields. This book deals with methods of working in the surface extractive industries, quarry management and power supply-but does not deal with related ancillary processes except where these affect quarrying operations.

The New Global Marketing: Local Adaptation for Sustainability and Profit discusses the ways that marketing managers can assess the potential for global expansion and help their firms capitalize on opportunities. The book explores which companies and products should expand internationally, what countries offer the best opportunities, and which marketing plan will lead each product or company to success. The material adapts well-established frameworks to demonstrate how the global marketer can assess company strengths and weaknesses and analyze opportunities and risks in foreign markets. It discusses the proper balance between standardization and localization, and addresses the importance of the "triple" bottom line - environmental sustainability, social fairness, and financial performance. Students also learn about bottom-of-the-pyramid markets, the role of digital global marketing, and the importance of adapting to international political, social, and environmental pressures. Featuring more than twenty original case studies, *The New Global Marketing* is an excellent introduction to what it really takes to succeed as a global marketer. Written for students with some marketing education and exposure to international business, the book is ideally suited to upper-level business courses and M.B.A. programs.

Transport Revolutions: Moving People and Freight without Oil sets out the challenges to our growing dependence on transport fuelled by low-priced oil. These challenges include an early peak in world oil production and profound climate change resulting in part from oil use. It proposes responses to ensure effective, secure movement of people and goods in ways that make the best use of renewable sources of energy while minimizing environmental impacts. Transport Revolutions synthesizes engineering, economics, environment, organization, policy and technology, and draws extensively on current data to present important conclusions. The authors argue that land transport in the first half of the 21st century will feature at least two revolutions. One will involve the use of electric drives rather than internal combustion engines. Another will involve powering many of these drives directly from the electric grid - as trains and trolley buses are powered today - rather than from on-board fuel. They go on to discuss marine transport, whose future is less clear, and aviation, which could see the most dramatic breaks from current practice. With its expert analysis of the politics and business of transport, Transport Revolutions is essential reading for professionals and students in transport, energy, town planning and public policy.
