Consumers are constantly inundated with repetitive traditional advertising

messages, bombarding their lives, interrupting their TV shows and generally getting in the way. The consumer does not feel any real emotional connection with these brands, and if they do buy, it is simply because the brand that shouted the loudest got their attention. This outdated approach to marketing communications is dying, and fast. Brands are realising that to secure the lifetime value of their customers by gaining true customer loyalty, they must give something back. The relationships between brands and their target audiences are being revolutionized. Experiential Marketing looks at the new experiential marketing era, which focuses on giving target audiences a fabulous brand-relevant customer experience that adds value to their lives. Experiential marketing is made up of live brand experiences - two way communications between consumers and brands, which are designed to bring brand personalities to life. This book demonstrates how experiential marketing fits in with the current marketing climate, and how to go about planning, activating and evaluating it for best results. This is essential reading for both advertising and marketing practitioners, and marketing students.

This book introduces the concept of software architecture as one of the cornerstones of software in modern cars. Following a historical overview of the evolution of software in modern cars and a discussion of the main

challenges driving that evolution, Chapter 2 describes the main architectural styles of automotive software and their use in cars ' software. Chapter 3 details this further by presenting two modern architectural styles, i.e. centralized and federated software architectures. In Chapter 4, readers will find a description of the software development processes used to develop software on the car manufacturers ' side. Chapter 5 then introduces AUTOSAR — an important standard in automotive software. Chapter 6 goes beyond simple architecture and describes the detailed design process for automotive software using Simulink, helping readers to understand how detailed design links to high-level design. The new chapter 7 reports on how machine learning is exploited in automotive software e.g. for image recognition and how both on-board and off-board learning are applied. Next, Chapter 8 presents a method for assessing the quality of the architecture — ATAM (Architecture Trade-off Analysis Method) — and provides a sample assessment, while Chapter 9 presents an alternative way of assessing the architecture, namely by using quantitative measures and indicators. Subsequently Chapter 10 dives deeper into one of the specific properties discussed in Chapter 8 — safety — and details an important standard in that area, the ISO/IEC 26262 norm. Lastly, Chapter 11 presents a set of future trends that are currently emerging and have the potential to shape automotive software engineering in the coming years. This book explores the concept of software architecture for modern cars and is intended for both beginning and advanced software designers. It mainly aims at two different groups of audience — professionals working with automotive software who need to understand concepts related to automotive architectures, and students of software engineering or related fields who need to understand the specifics of automotive software to be able to construct cars or their components. Accordingly, the book also contains a wealth of real-world examples illustrating the concepts discussed and requires no prior background in the automotive domain. Compared to the first edition, besides the two new chapters 3 and 7 there are considerable updates in chapters 5 and 8 especially. [New Car Buying Guide 2005](#)
