The White House Family Cookbook Springer Science & Business Media

As indicated by its title, this monograph deals chiefly with morphologically recognizable deviations from the normal anatomical condition of the human CNS. The AD-associated pathology is illustrated from its beginnings (sometimes even in childhood) to its final form, which is reached late in life. The AD process commences much earlier than the clinically recognizable phase of the disorder, and its timeline includes an extended preclinical phase. The further the pendulum swings away from the symptomatic final stages towards the early pathology, the more obvious the lesions become, although from a standpoint of severity they are more unremarkable and thus frequently overlooked during routine neuropathological assessment. For this reason, the authors deal with the hallmark lesions in the early phases of the AD process in considerable detail

Engine Code Manual Compendium Publishing & Communications

Originally published in German and French, the work is considered to be unsurpassed in both its scientific eloquence and accurate photographic documentation. Revising Brodmann's cortical parcellation system, von Economo took cytoarchitectonics to a new zenith.>The revised edition contains newly compiled tables with extensive quantitative data on the 107 cytoarchitectonic areas of Economo and Koskinas, plus all the 'transition' areas and full reproductions of the original microphotographs. It also contains the concluding chapter that appeared only in the 1929 English edition, with Economo's later views on cytoarchitectonic neuropathology and evolutionary neuroscience, enriched with material and figures from his later studies. Last but not least a newly discovered manuscript by Georg N. Koskinas, appears in English for the first time. In it, Economo's collaborator presents an insightful analysis of the 'General Part' of their larger textbook of cytoarchitectonics.

Campbell and Brodmann were pioneers in the study of the cerebral cortex architectonics and the precentral area of the cerebral cortex is known as "Campbell's area".

Atlas of the Human Brain Springer Science & Business Media

This unique book provides a new view of the organization of the cerebral cortex. It explores the underlying principle of the organization of the cerebral cortex using the dual nature of the origin of the cerebral cortex. Cerebral Cortex provides a different way of understanding the current behavioral studies, neuroimaging observations, and promises a new approach to future studies.

Carpenter's Human Neuroanatomy Random House Books for Young Readers

This comprehensive reference is clearly destined to become the definitive anatomical basis for all molecular neuroscience research. The three volumes provide a complete overview and comparison of the structural organisation of all vertebrate groups, ranging from amphioxus and lamprey through fishes, amphibians and birds to mammals. This thus allows a systematic treatment of the concepts and methodology found in modern comparative neuroscience. Neuroscientists, comparative morphologists and anatomists will all benefit from: * 1,200 detailed and standardised neuroanatomical drawings * the illustrations were painstakingly hand-drawn by a team of graphic designers, specially commissioned by the authors, over a period of 25 years * functional correlations of vertebrate brains * concepts and methodology of modern comparative neuroscience * five full-colour posters giving an overview of the central nervous system of the vertebrates, ideal for mounting and display This monumental work is, and will remain, unique; the only source of such brilliant illustrations at both the macroscopic and microscopic levels.

Hiawatha's Brothers Springer

First English edition of a rare gem in the neurological sciences A milestone in neuroscience research, this high-profile Atlas depicts the cellular structure of practically every area of the human cortex with direct applications to current research in brain function. The entirety of the 112 original microphotographic plates, brilliant achievements in scientific microphotography and representing the 107 cytoarchitectonic areas of the human cerebral cortex, are reproduced in full size - large enough to be used for teaching purposes. An extensive introduction places the cytoarchitectonic studies of von Economo and Koskinas in a historical as well as a modern perspective, summarizing the essence of their findings and providing Brodmann area correlations. Biographies of von Economo and Koskinas and complete listings of their hard-to-find works are included in the Appendix. Originally published in German in 1925, it was considered a 'royal gift to science'. Revising Brodmann's nomenclature of 1909, the Nobel prize nominee von Economo and his colleague Koskinas took cytoarchitectonics to a new zenith, filling in gaps left by Brodmann on normal cortical structure, and documenting detailed findings in the frontal, parietal, temporal and occipital lobes, the insula, hippocampus, and superior limbic region. Far from being of purely academic or historical interest, this essential guide for all research on the cerebral cortex is of fundamental value to investigators in the brain and behavioral sciences, including basic, cognitive and evolutionary neuroscience, neuroanatomy, neurophysiology, neuroimaging, neuropsychology and neurolinguistics, as well as to physicians in the clinical fields of neurology, neuropathology, neurosurgery and psychiatry.

The Primate Brain

As MRI research becomes more detailed and specialized, it becomes essential to have detailed atlases that also explain individual variability, but other atlases do not provide this detail and leave users without illustration of, or guidance regarding how to deal with the variability they inevitably encounter in research and practice. This book serves as the first cortex atlas to address this growing need, appealing to clinicians, researchers and graduate students in neuroscience, neurology, neurosurgery and radiology. The atlas provides nearly 200 photographs of 3D reconstructions of human brains in a standard series of coronal, sagittal, and horizontal sections. It illustrates in detail and labels 95% of the cortex sulci and gyri, and images are presented in the MNI stereotaxic space. In addition to the standard brain and its sections are numerous examples of brains that exhibit patterns of deviating sulci and gyri. Examples of these variants are presented next to the standard illustration, accompanied by brief commentary aimed at helping users identify these variants and use them in their own work

Histological Studies on the Localisation of Cerebral Function

This is the third edition of the translation, by Laurence Garey, of "Vergleichende Lokalisationslehre der Grosshirnrinde" by Korbinian Brodmann, originally published by Barth-Verlag in Leipzig in 1909. It is one of the major "classics" of the neurological world. Even today it forms the basis for so-called "localisation" of function in the cerebral cortex. Brodmann's "areas" are still used to designate functional regions in the cortex, the part of the brain that brings the world that surrounds us into consciousness, and which governs our responses to the world. For example, we use "area 4" for the "motor" cortex, with which we control our muscles, "area 17" for "visual" cortex, with which we see, and so on. This nomenclature is used by neurologists and neurosurgeons in the human context, as well as by experimentalists in various animals. Indeed, Brodmann's famous "maps" of the cerebral cortex of humans, monkeys and other mammals must be among the most commonly reproduced figures in neurobiological publishing. The most famous of all is that of the human brain. There can be few textbooks of neurology, neurophysiology or neuroanatomy in which Brodmann is not cited, and his concepts pervade most research publications on systematic neurobiology. In spite of this, few people have ever seen a copy of the 1909 monograph, and even fewer have actually read it! There had never been a complete English translation available until the first edition of the present translation of 1994, and the original book had been almost unavailable for 50 years or more, the few antiquarian copies still around commanding high prices. As Laurence Garey, too, used Brodmann's findings and maps in his neurobiological work, and had the good fortune to have access to a copy of the book, he decided to read the complete text and soon discovered that this was much more than just a report of laboratory findings of a turn-of-the-twentieth-century neurologist. It was an account of neurobiological thinking at that time, covering aspects of comparative neuroanatomy, neurophysiology and neuropathology, as well as giving a fascinating insight into the complex relationships between European neurologists during the momentous times when the neuron theory was still new.

Cellular Structure of the Human Cerebral Cortex

The study and modulation of cortical connections is a rapidly growing area in neuroscience. This unique book by prominent researchers in the field covers recent advances in this area. The first section of the book describes studies of cortical connections, modulation of cortical connectivity and changes in cortical connections with activities such as motor learning and grasping in primates. The second section covers the use of non-invasive brain stimulation to study and modulate cortical connectivity in humans. The last section describes changes in brain connectivity in neurological and psychiatric diseases, and potential new treatments that manipulate brain connectivity. This book provides an up-to-date view of the study of cortical connectivity, and covers its role in both fundamental neuroscience and potential clinical applications.
