This textbook provides a graduate-level introduction to the spectral theory of linear operators on Banach and Hilbert spaces, guiding readers through key components of spectral theory and its applications in quantum physics. Based on their extensive teaching experience, the authors present topics in a progressive manner so that each chapter builds on the ones preceding. Researchers and students alike will also appreciate the exploration of more advanced applications and research perspectives presented near the end of the book. Beginning with a brief introduction to the relationship between spectral theory and quantum physics, the authors go on to explore unbounded operators, analyzing closed, adjoint, and self-adjoint

operators. Next, the spectrum of a closed operator is defined and the fundamental properties of Fredholm operators are introduced. The authors then develop the Grushin method to execute the spectral analysis of compact operators. The chapters that follow are devoted to examining Hille-Yoshida and Stone theorems, the spectral analysis of self-adjoint operators, and trace-class and Hilbert-Schmidt operators. The final chapter opens the discussion to several selected applications. Throughout this textbook, detailed proofs are given, and the statements are illustrated by a number of well-chosen examples. At the end, an appendix about foundational functional analysis theorems is provided to help the uninitiated reader. *A Guide to Spectral Theory: Applications and Exercises* is intended for graduate students taking an introductory course in spectral theory or operator theory. A background in linear functional analysis and partial differential equations is assumed; basic knowledge of bounded linear operators is useful but not required. PhD students and researchers will also find this volume to be of interest, particularly the research directions provided in later chapters.

Let me welcome you to Germany, English-speaking travellers. I know the two reasons you come here for, because I often meet you at the usual places going fast: There is a) the Nordschleife of the Nürburgring which to you is the only thing interesting about the Ring, and there is b) the Autobahn. Let's just

leave a) because you already are much more obsessed with the Nürburgring than we are (or is entirely healthy) and proceed straight to the limitless speed potential of b) our motorway network. There is much fun to be had here, but you can also return home frustrated and with enough speeding tickets to keep you warm in winter. So you may want to listen to the following pro tips from a frequent flyer.
