Coastal Conservation and Management provides the reader with a synthesis of the range and variation of the main coastal formations and includes practical guidance on their management.

The book discusses all the main coastal habitats of importance for nature conservation (saltmarsh, shingle, sand dune and seacliff) as well as combinations of these habitats (estuaries and other coastal wetlands). It offers a comprehensive picture of both the soft sedimentary formations and those which are more resilient. While these habitats have all been covered elsewhere in the literature, no single volume gives such a wide-ranging account. An attempt is made throughout

to provide the reader with a basic understanding of the importance and range of variation of each habitat and coastal ecosystem. The principal issues are discussed and the key management options identified. Some prescriptive suggestions are made, though for the most part, the reader is left to ponder the issues and their possible solutions. The book argues for a more dynamic approach to the conservation of coastal habitats commensurate with the nature of the ecosystems themselves. Coastal Conservation and Management also stresses interrelationships with human use. By bringing these elements together, it highlights the need for new approaches to conservation management, which accept that change can be a healing force in the rehabilitation of degraded coastal areas. In this context, the book brings the geomorphology of coastal systems to the fore, suggesting that they may be

---

more robust than is normally suggested. In the face of global warming, Coastal Conservation and Management also advocates a reappraisal of the value of natural systems as a means of providing a more flexible and efficient response to rising sea levels.

Cutting temperatures are the main factor adversely affecting the product quality and limiting the productivity in the manufacture of safety-critical aero engine components.

This work presents the development of a monitoring solution enabling the detection of critical process conditions and therewith allows manufacturers to adapt processes appropriate to the situation. Finally, suggestions for an industrial implementation

and an outlook to a temperature controlled process are given.

Enzyme Technology is one the most promising disciplines in modern biotechnology. In this book, the applications of a wide variety of enzymes are highlighted. Current studies in enzyme technology are focused towards the discovery of novel enzymes (termed “ bio-discovery ” or “ bio-prospecting ” ) and the identification and elucidation of novel pathways of these novel enzymes with emphasis on their industrial relevance. With the development of molecular techniques and other bioinformatics tools, the time to integrate this subject with other fields in the life sciences has arrived. A rapid expansion of the knowledge base in the

field of enzyme biotechnology has occurred over the past few years. Much of this expansion has been driven by the bio-discovery of many new enzymes from a wide range of environments, some extreme in nature, followed by subsequent protein (enzyme) engineering. These enzymes have found a wide range of applications, ranging from bioremediation, bio-monitoring, biosensor development, bioconversion to biofuels and other biotechnologically important value-added products. Hydrolases constitute a major component of the global annual revenue generated by industrial enzymes and the emphasis has therefore been placed on these enzymes and their applications. With the immense interest of researchers active in this area, this book will serve to provide information on current aspects in this field of study. In the current edition, the contributions of many

---

diversified topics towards establishing new directions of research in the area of enzyme biotechnology are described. This book serves to provide a unique source of information to undergraduates, post graduates and doctoral courses in microbiology and biotechnology along with allied life sciences. The present edition of the book covers all important areas of enzyme biotechnology i.e. the wide variety of enzymes in the field of enzyme biotechnology and their industrial applications, new methods and state-of-the-art information on modern methods of enzyme discovery. This book will act as good resource on most of the current facets of enzyme technology for all students engaged in bioengineering and biotechnology.
