In this book, Alec Fisher aims to teach directly an important range of thinking skills. The skills are fundamental critical (and creative) thinking skills, and they are taught in a way which expressly aims to facilitate their transfer to other subjects and other contexts. The method is to use 'thinking maps' which help improve thinking by asking key questions of students when they are faced with different types of problems. Alec Fisher explains the language of reasoning, how to understand different kinds of arguments and how to ask the right question. Other topics include: different patterns of reasoning and standards which apply in different contexts, how to clarify and interpret ideas, how to judge the credibility of claims, and how to decide whether a person really justifies their conclusions, given their audience. Particular attention is given to understanding casual explanations and evaluating decisions. The book includes many examples and exercises which give extensive practice in developing critical-creative thinking skills.

What do we actually "know" about the world through our senses? These are but a few of the fascinating questions that are addressed in D. Alan Bensley's engaging new book, *Critical Thinking in Psychology: A Unified Schools Approach*. With each question illustrating the need for critical thinking, Bensley piques student interest and inspires them to think more effectively and critically about both the common and uncommon. Without telling readers what to think, Bensley helps them learn how to think critically about the issues often raised in psychology. And while obtaining answers to the above questions is important, Bensley shows readers how the process of drawing sound conclusions to these queries is even more important.

An interactive version of Volume 1 allows users to specify their areas of interest and create a customized search of assessment measures in the three domain areas. The tests described in Volume 1 are those that are designed to measure cognitive variables for traditional students. The routine jobs of yesterday are being replaced by technology and/or shipped off-shore. In their place, job categories that require knowledge management, abstract reasoning, and personal services seem to be growing. The modern workplace requires workers to have broad cognitive and affective skills. Often referred to as "21st century skills," these skills include being able to solve complex problems, to think critically about tasks, to effectively communicate with people from a variety of different cultures and using a variety of different techniques, to work in collaboration with others, to adapt to rapidly changing environments and conditions for performing tasks, to effectively manage one's work, and to acquire new skills and information on one's own. The National Research Council (NRC) has convened two prior workshops on the topic of 21st century skills. The first, held in 2007, was designed to examine research on the skills required for the 21st century workplace and the extent to which they are meaningfully different from earlier eras and require corresponding changes in educational experiences. The second workshop, held in 2009, was designed to explore demand for these types of skills, consider intersections between science education reform goals and 21st century skills, examine models of high-quality science instruction that may develop the skills, and consider science teacher readiness for 21st century skills. The third workshop was intended to delve more deeply into the topic of assessment. The goal for this workshop was to capitalize on the prior efforts and explore strategies for assessing the five skills identified earlier. The Committee on the Assessment of 21st Century Skills was asked to organize a workshop that reviewed the assessments and related research for each of the five skills identified at the previous workshops, with special attention to recent developments in technology-enabled assessment of critical thinking and problem-solving skills. In designing the workshop, the committee collapsed the five skills into three broad clusters as shown below: Cognitive skills: nonroutine problem solving, critical thinking, systems thinking Interpersonal skills: complex communication, social skills, team-work, cultural sensitivity, dealing with diversity Intrapersonal skills: self-management, time management, self-development, self-regulation, adaptability, executive functioning Assessing 21st Century Skills provides an integrated summary of the presentations and discussions from both parts of the third workshop.
