This far-reaching resource covers a full spectrum of multi-faceted considerations critical for energy generation decision makers considering the adoption or expansion of wind power facilities. It contextualizes pivotal technical information within the real complexities of economic, environmental, practical and socio-economic parameters. This matrix of coverage includes case studies and analysis from developed and developing regions, including North America and Europe, Asia, Latin America, the Middle-East and Africa. Crucial issues to power generation professionals and utilities such as: capacity credits; fuel saving; intermittency; penetration limits; relative cost of electricity by generation source; growth and cost trends; incentives; and wind integration issues are addressed. Other economic issues succinctly discussed inform financial commitment to a project, including investment matrices, strategies for economic evaluations, econometrics of wind energy, cost comparisons of various investment strategies, and cost comparisons with other energy sources. Due to its encompassing scope, this reference will be of distinct interest to practicing engineers, policy and decision makers, project planners, investors and students working in the area of wind energy for power generation.

A key question for China, which has for some time been a leading global manufacturing base, is whether China can progress from being a traditional centre of manufacturing to becoming a centre for innovation. In this book, Shang-Ling Jui focuses on China's software industry and examines the complete innovation value chain of software in its key phases of innovation, standards definition, development and marketing. He argues that, except for software development, these key phases are of high added-value and that without adopting the concept of independent innovation as a guiding ideology, China's software enterprises - like India's - would have an uncertain future. In other words, the lack of core competence in the development of China's software industry might restrain the industry from taking the leading position and drive it towards becoming no more than the software workshop of multinationals over the long term. Shang-Ling Jui contends that China's software industry should and can possess its own complete innovation value chain. Having worked in China's software industry for many years, the author provides an inside-out perspective - identifying the strengths and weaknesses of the industry and defining the challenges in China's transition from "Made in China" to "Innovated in China."

The shopper marketing methodology is a powerful, complete approach for satisfying target consumer demand at the point of maximum influence, and thereby driving consumers to purchase. It gives companies a far deeper understanding how target consumers behave as shoppers, and leverages this intelligence across the entire supply chain to benefit all stakeholders: companies, brands, consumers, retailers, and shoppers. It requires supply chain partners to smoothly integrate complex sets of marketing and sales tools, in order to engage shoppers, build brand equity, and persuade shoppers when they move into "shopping mode." Internally, it also demands deeper coordination of R and D, marketing innovation, operations, logistics, and distribution. It isn't easy, but it offers remarkable, proven results that are virtually unachievable any other way. In Shopper Marketing, three of the field's pioneering innovators and consultants bring together state-of-the-art insights, strategic approaches, and supply chain execution methods for successfully deploying shopper marketing initiatives throughout your organization. Daniel Flint, Chris Hoyt and Nancy Swift clearly explain what shopper marketing is, and why it is critical for marketers to master. They review each of its six objectives and eight foundational principles, demonstrating how to adapt and apply it in your environment, overcome obstacles, avoid mistakes, and systematically create value along your entire "path to purchase." Drawing on their unsurpassed consulting experience, they also assess emerging trends and their implications, helping you deepen customer loyalty, extend competitive advantage, and improve profitability for years to come.

Wind Energy for Power Generation

Many companies have a complex process for purchasing software that is required by IT projects, or better, by the business. Usually software is purchased by a centralized procurement function, and is either purchased on a project-by-project basis or as a large periodic software contract. Unfortunately purchasing software products does not automatically mean that these products are exploited throughout the organization providing the maximum possible value to the business units. Several issues call for a structured approach that gets the most business value out of software already purchased. The objectives of this approach are to: Create maximum awareness throughout the organization of the software purchased. Track software use in IT projects and act if products are not used at all, used improperly, or insufficiently used. Facilitate use of software products in projects, especially when software products are complex and require a lot of integration. We can summarize the overall objective of this approach as ensuring that the business units in an organization obtain the maximum possible value of software products purchased, which is also the scope of this IBM® Redbooks® publication.
