This book integrates the disciplines of cancer pathology and epidemiology to provide a synergistic and complementary approach to understanding the molecular mechanisms of cancer. This book provides relevant information on the diagnostic, prognostic and predictive molecular pathology of cancer. Epidemiological studies, including descriptive epidemiology, risk factors and molecular mechanisms of disease inform on the etiology and progression of cancer. The text concentrates on major cancers that are currently prevalent and those for which substantial molecular, pathological and epidemiological data is available. Each section is designed to provide an overview of that cancer type in terms of basic biology, review the current epidemiological data surrounding that cancer type and provide information on common practices and challenges related to the molecular pathology of that cancer type. Several relevant techniques in molecular pathology, which facilitate diagnosis and treatment are also explored. Pathology and Epidemiology of Cancer provides a succinct and comprehensive overview of multiple cancer types to guide clinicians during patient care and to guide scientists for innovations in research. It represents an integral resource for pathologists, epidemiologists, medical students as well as translational, basic and clinical science researchers who are all working to progress the field of cancer in terms of diagnosis, treatment and prevention.

The mammalian gastrointestinal mucosa is a rapidly self-renewing tissue in the body, and its homeostasis is preserved through the strict regulation of epithelial cell proliferation, growth arrest, and apoptosis. The control of the growth of gastrointestinal mucosa is unique and, compared with most other tissue in the body, complex. Mucosal growth is regulated by the same hormones that alter metabolism in other tissues, but the gastrointestinal mucosa also responds to host events triggered by the ingestion and presence of food within the digestive tract. These gut hormones and peptides regulate the growth of the exocrine pancreas, gallbladder epithelium, and the mucosa of the oxyntic gland region of the stomach and the small and large intestines. Luminal factors, including nutrients or other dietary factors, secretions, and microbes that occur within the lumen and distribute over a proximal-to-distal gradient, are also crucial for maintenance of normal gut mucosal regeneration and could explain the villous-height-crypt-depth gradient and variety of adaptation, since these factors are diluted, absorbed, and destroyed as they pass down the digestive tract. Recently, intestinal stem cells, cellular polyamines, and noncoding RNAs are shown to play an important role in the regulation of gastrointestinal mucosal growth under physiological and various pathological conditions. In this book, we highlight key issues and factors that control gastrointestinal mucosal growth and homeostasis, with special emphasis on the mechanisms through which epithelial renewal and apoptosis are regulated at the cellular and molecular levels.

The “ Diversity in Clinical Neuropsychology ” series is designed to highlight cultural and moderator variables involved in the study of brain-behavior relationships. Historically, the study of psychology and neuropsychology has focused on the male brain being the standard to which all or most variables are considered. The study of sex differences is perhaps the most provoking and far-reaching aspect of diversity because frequently women have unique assessment and treatment needs. For example, frontal lobe functioning tends to be more contextual for women than for men. These brain functions have behavioral counterparts that directly relate to how interventions may be tailor made to suit the female rather than male patient. The goal in neuropsychology is always to improve diagnosis and treatment outcomes, and a cohesive summary of the neuropsychology of the female brain would raise awareness and cultural competency of clinicians in neuropsychology. Authors will focus on sex differences in the neuropsychological, cognitive, and development literature; ethnic and socioeconomic variables affecting diagnosis and treatment of women; and social/emotional and behavioral manifestations of neuropsychological sex differences.
