When engine speed starts to rise or fall in response to a change in the load. The governor responds opening or closing the throttle with the help of the governor spring.

### Where Does The Governor Spring

A mechanical governor uses flyweights to

create a force based off of crankshaft speed which is balanced by the force of the governor spring. The top engine speed is varied by increasing the spring force to run faster or decreasing the force to run slower. The governor spring wants to open the throttle and the governor tries to close the throttle.
