A system and method for simultaneously collecting serial number information reports from numerous colliding coded-radio-frequency identity tags. Each tag has a unique multi-digit serial number that is stored in non-volatile RAM. A reader transmits an ASCII coded "D" character on a carrier of about 900 MHz and a power illumination field having a frequency of about 1.6 Ghz. A one MHz tone is modulated on the 1.6 Ghz carrier as a timing clock for a microprocessor in each of the identity tags. Over a thousand such tags may be in the vicinity and each is powered-up and clocked by the 1.6 Ghz power illumination field. Each identity tag looks for the "D" interrogator modulated on the 900 MHz carrier, and each uses a digit of its serial number to time a response. Clear responses received by the reader are repeated for verification. If no verification or a wrong number is received by any identity tag, it uses a second digital together with the first to time out a more extended period for response. Ultimately, the entire serial number will be used in the worst case collision environments; and since the serial numbers are defined as being unique, the final possibility will be successful because a clear time-slot channel will be available.

United States Army Serial Number 37531447 is a wartime autobiography giving vivid accounts of emotions, unrevised history and erratum on both the training fields and during the riggers of battle. The author relates happenings of a World War II "noncom" soldier known by his army serial number of 37531447. It is an unpretentious allegory of men at arms. The book is authored with a wonderful humorous and human perspective. It comes from a different viewpoint...one chronicling the experience of military life for a naive young man coming from the vast pastoral tall grass prairie of the Flint Hills of Kansas. This young lad from Chase County, the county's first Eagle Scout, skillfully narrates the slow subtle transition of values in his life as a former civilian...to that of a well-trained combat soldier, doing what warriors have been conditioned to endure and do.

"Serial number restoration is a common and successful process of revealing obliterated serial numbers on firearms. In a crime laboratory setting, obliterated serial numbers are commonly processed in order to tie a person to a crime scene or provide an investigative lead for officers. Currently serial numbers are restored using a chemical etchant method that can eat away at the metal on the firearm even after the examination is complete. It can also take several hours to complete and only provide an examiner with a partial number. There are other nondestructive options however little

to no literature is available. The purpose of this study is to discover new methods for nondestructive serial number restoration and to compare them to the traditional chemical method used. Metal bars of premeasured obliteration depths and different compositions were examined using three proposed experimental methods: near infrared imaging, cold frost, and scanning acoustic microscopy. Results did not indicate significant difference in the median number of visible digits recovered for each of the three proposed methods compared to the traditional chemical method. There were significant results in the median number of composition utilized and depth of obliteration. This indicates that different firearm compositions and depth of obliteration has an effect on serial number restoration.."--Abstract.

The restoration of obliterated serial numbers by both chemical and physical means has been well documented in the field of forensic science. An interesting case of a severely obliterated serial number was submitted to our laboratory for restoration. Despite development with Fry's etchant, the visualization, documentation, and photography of the restored serial number proved difficult because of the deep "pock" type of obliteration. The scanning electron microscope was explored as a potential means for assisting in the examination of the restored serial number. The scanning electron microscope successfully provided a simple means for the visualization, documentation, and photography of the restored serial number.

Vietnam POWs came home heroes, but twenty years earlier their predecessors returned from Korea to shame and suspicion. In the Korean War American prisoners were used in propaganda twice, first during the conflict, then at home. While in Chinese custody in North Korea, they were pressured to praise their treatment and criticize the war. When they came back, the Department of the Army and cooperative pundits said too many were weaklings who did not resist communist indoctrination or "brainwashing." Ex-prisoners were featured in a publicity campaign scolding the nation to raise tougher sons for the Cold War. This propaganda was based on feverish exaggerations that ignored the convoluted circumstances POWs were put in, which decisions in Washington helped create.

Ferrari Serial Numbers Part II is the only publicly available Ferrari Serial Number database. The title covers the even numbered chassis (racing cars) through serial number 1050. Compiled in 1989 by preeminent Ferrari Historians Hilary Raab and Dyke Ridgley, the title is the definitive serial number database. The edition presented here is unchanged from the original 1989 version and has not been updated. While some of the information regarding the cars has subsequently changed, the title is still a unique and invaluable reference work for the serious Ferrari Historian. The accompanying title, Ferrari Serial Numbers Part I, covers the odd numbered chassis (road cars) to serial number 21399.
