Identification Valueguide**
The serial numbers of

stolen or misused items are sometimes removed to prevent their identification [1]. Since these serial numbers are generally recorded on metal items by being stamped into the metal, the marking is only present on the surface and can be readily removed by filing or grinding. Such removal of the number generally does not affect the usefulness of the item, since the number is usually stamped in a noncritical region of the outer surface.

Tractor Serial Number
Image Comics
Ferrari Serial Numbers Part II is the only publicly available Ferrari Serial Number database. The title covers the even numbered chassis (racing cars) through serial number 1050. Compiled in 1989 by preeminent Ferrari Historians Hilary Raab and Dyke Ridgley, the title is the definitive serial number database. The edition presented here is unchanged from the original 1989 version

and has not been updated. While some of the information regarding the cars has subsequently changed, the title is still a unique and invaluable reference work for the serious Ferrari Historian. The accompanying title, *Ferrari Serial Numbers Part I*, covers the odd numbered chassis (road cars) to serial number 21399.

"Serial number restoration is a

common and successful process of revealing obliterated serial numbers on firearms. In a crime laboratory setting, obliterated serial numbers are commonly processed in order to tie a person to a crime scene or provide an investigative lead for officers. Currently serial numbers are restored using a chemical etchant method that can eat away at the metal on the firearm even after the examination is complete. It can also take several hours to complete and only provide an examiner with a partial number. There are other nondestructive options however little to no literature is available. The purpose of this study is to discover new methods for nondestructive serial

number restoration and to compare them to the traditional chemical method used. Metal bars of premeasured obliteration depths and different compositions were examined using three proposed experimental methods: near infrared imaging, cold frost, and scanning acoustic microscopy. Results did not indicate significant difference in the median number of visible digits recovered for each of the three proposed methods compared to the traditional chemical method. There were significant results in the median number of composition utilized and depth of obliteration. This indicates that different firearm compositions and depth of obliteration has an effect on serial

number restoration.."--Abstract.
The Assessment of Experimental Methods of Serial Number Restoration
The restoration of obliterated serial numbers by both chemical and physical means has been well documented in the field of forensic science. An interesting case of a severely obliterated serial number was submitted to our laboratory for restoration. Despite development with Fry's etchant, the visualization, documentation, and photography of the restored serial number proved difficult because of the deep "pock" type of obliteration. The scanning electron microscope was explored as a potential means for assisting in the examination of

the restored serial number. The scanning electron microscope successfully provided a simple means for the visualization, documentation, and photography of the restored serial number.
