Removing Stains from Fabrics
[Hull, Quebec] : Environment Canada, Environmental Protection Service

People's desire to understand the environments in which they live is a natural one. People spend most of their time in spaces and structures designed, built, and managed by humans, and it is estimated that people in developed countries now spend 90 percent of their lives indoors. As people move from homes to workplaces, traveling in cars and on transit systems, microorganisms are continually with and around them. The human-associated microbes that are shed, along with the human behaviors that affect their transport and removal, make

significant contributions to the diversity of the indoor microbiome. The characteristics of "healthy" indoor environments cannot yet be defined, nor do microbial, clinical, and building researchers yet understand how to modify features of indoor environments—such as building ventilation systems and the chemistry of building materials—in ways that would have predictable impacts on microbial communities to promote health and prevent disease. The factors that affect the environments within buildings, the ways in which building characteristics influence the composition and function of indoor microbial communities, and the ways in which these microbial communities relate to human health and well-being are extraordinarily complex and can be explored only as a dynamic, interconnected ecosystem by engaging the fields of microbial biology and ecology, chemistry, building science, and human physiology. This report reviews what is known about the intersection of these disciplines, and how new tools may facilitate advances in understanding the ecosystem of built environments, indoor microbiomes, and effects on human health and well-being. It offers a research agenda to generate the information needed so that stakeholders with an interest in understanding the impacts of built environments

will be able to make more informed decisions.

Traditionally, electrical machines are classified into d. c. commutator (brushed) machines,

induction (asynchronous) machines and

synchronous machines. These three types of electrical machines are still regarded in many

academic curricula as fundamental types,

despite that d. c. brushed machines (except

small machines) have been gradually

abandoned and PM brushless machines

(PMBM) and switched reluctance machines

(SRM) have been in mass production and use

for at least two decades. Recently, new

topologies of high torque density motors, high

speed motors, integrated motor drives and

special motors have been developed. Progress

in electric machines technology is stimulated

by new materials, new areas of applications,

impact of power electronics, need for energy

saving and new technological challenges. The

development of electric machines in the next

few years will mostly be stimulated by

computer hardware, residential and public

applications and transportation systems (land,

sea and air). At many Universities teaching and

research strategy oriented towards electrical

machinery is not up to date and has not been

changed in some countries almost since the end

of the WWII. In spite of many excellent

academic research achievements, the

academia–industry collaboration and

technology transfer are underestimated or, quite

often, neglected. Underestimation of the role of

industry, unfamiliarity with new trends and

restraint from technology transfer results, with

time, in lack of external financial support and

drastic decline in the number of students

interested in Power Electrical Engineering.

Since the 1960s, the class action lawsuit has been a powerful tool for holding businesses accountable. Yet years of attacks by corporate America and unfavorable rulings by the Supreme Court have left its future uncertain. In this book, Brian T. Fitzpatrick makes the case for the importance of class action litigation from a surprising political perspective: an unabashedly conservative point of view. Conservatives have opposed class actions in

recent years, but Fitzpatrick argues that they should see such litigation not as a danger to the economy, but as a form of private enforcement of the law. He starts from the premise that all of us, conservatives and libertarians included, believe that markets need at least some rules to thrive, from laws that enforce contracts to laws that prevent companies from committing fraud. He also reminds us that conservatives consider the private sector to be superior to the government in most areas. And the relatively little-discussed intersection of those two beliefs is where the benefits of class action lawsuits become clear: when corporations commit misdeeds, class action lawsuits enlist the private sector to intervene, resulting in a smaller role for the government, lower taxes, and, ultimately, more effective solutions. Offering a novel argument that will surprise partisans on all sides, *The Conservative Case for Class Actions* is sure to breathe new life into this long-running debate.

Providing a 'one stop' text, *Understanding the Voices and Educational Experiences of Autistic Young People* is a unique and comprehensive contribution to bridge the gap between theory, research and practice. Based on the author's teaching and research experience, this book provides a theoretical and practical framework for participatory rights-based autism research and demonstrates the benefits of – and growing emphasis on – voice and participation research; if done correctly it can be of immense benefit to policy, practice and how we support autistic young people. Alongside a critical and extensive review of research literature and debate on the efficacy of mainstream inclusion for autistic children, the book provides practical advice on how to support autistic children in research and in school. Significantly, Goodall investigates and presents the educational experiences of autistic young people – including girls – and their suggestions to improve educational practice from their own perspectives, as opposed to adult stakeholders. This book will act as a key text for student teachers, practitioner-researchers, those already supporting autistic children in education or social settings (including teachers, school leaders, special education leads, policymakers) and academics researching in the areas of autism and

inclusion.
