<p>Design and Analysis of Composite Structures enables graduate students and engineers to generate meaningful and robust designs of complex composite structures. Combining analysis and design methods for structural components, the book begins with simple topics such as skins and stiffeners and progresses through to entire components of fuselages and wings. Starting with basic mathematical derivation followed by simplifications used in real-world</p>	<p>design, Design and Analysis of Composite Structures presents the level of accuracy and range of applicability of each method. Examples taken from actual applications are worked out in detail to show how the concepts are applied, solving the same design problem with different methods based on different drivers (e.g. cost or weight) to show how the final configuration changes as the requirements and approach change. Provides a toolkit of analysis and</p>	<p>design methods to most situations encountered in practice, as well as analytical frameworks and the means to solving them for tackling less frequent problems. Presents solutions applicable to optimization schemes without having to run finite element models at each iteration, speeding up the design process and allowing examination of several more alternatives than traditional approaches. “ Your genome is an  
email attachment ”  
What a difference a  
few years can make?  
In 2001, to a global  
fanfare, the  
completion of the first  
draft sequence of the  
human genome was  
announced. This had  
been a Herculean  
effort, involving  
thousands of

researchers and  
millions of dollars.  
Today, a project to re-  
sequence 1,000  
genomes is well  
underway, and within  
a year or two, your  
own “ personal  
genome ” is likely to  
be available for a few  
thousand pounds, a  
price that will  
undoubtedly decrease  
further. We are fast  
approaching the day  
when your genome  
will be available as an  
email attachment  
(about 4 Mb). The key  
to this feat is the fact  
that any two human  
genomes are more  
than 99% identical, so  
rather than  
representing every  
base, there is really  
only a requirement to  
store the 1% of  
variable sequence  
judged against a  
common reference  
genome. This brings  
us directly to the focus

of this edition of  
Methods in Molecular  
Biology, Genetic  
Variation. The  
human genome was  
once the focus of  
biology, but now  
individual genome  
var- tion is taking the  
center stage. This new  
focus on individual  
variation ultimately  
democ- tizes biology,  
offering individuals  
insight into their own  
phenotype. But these  
advances also raise  
huge concerns of data  
misuse,  
misinterpretation, and  
misunderstanding.  
The immediacy of  
individual genomes  
also serves to highlight  
our relative ignorance  
of human genetic  
variation, underlining  
the need for more  
studies of the nature  
and impact of genetic  
variation on human  
phenotypes.

Epic Turtle Tales (Teenage Mutant Ninja Turtles)

Arms & Armour  
This is one of the most significant military books of the twentieth century. By an outstanding soldier of independent mind, it pushed forward the evolution of land warfare and was directly responsible for

German armoured supremacy in the early years of the Second World War. Published in 1937, the result of 15 years of careful study since his days on the German General Staff in the First World War, Guderian's book argued, quite clearly, how vital the proper use of tanks and supporting armoured vehicles would be in the conduct of a future war. When that war came, just two years later, he proved it, leading his Panzers with distinction in the Polish, French and Russian

campaigns. Panzer warfare had come of age, exactly as he had forecast. This first English translation of Heinz Guderian's classic book - used as a textbook by Panzer officers in the war - has an introduction and extensive background notes by the modern English historian Paul Harris. The matrix isolation (MI) method has now been used for nearly thirty years. During this period it has

been actively developed and the range of problems tackled greatly extended. Originally it was used for studies of transient species involving vibrational, electronic and ESR spectroscopy. Nowadays the study of transient species forms a comparatively small part of HI work since it has been amply demonstrated that very fruitful information can be obtained of the structure and interactions of stable molecules and their aggregates. In addition to the spectroscopic methods mentioned above the MI technique is

nowadays a standard method in research based on vibrational relaxation, luminescence, Mossbauer, magnetic circular dichroism, pulsed NMR and photoelectron spectroscopy. The matrix isolation technique affords considerable advantages over more conventional methods in most applications of spectroscopy. Areas where the technique has been widely applied, or shows great potential, include: metal atom chemistry, and its relation to surface chemistry, high temperature inorganic species, transition metal

complexes, interstellar species, free radicals and unstable molecules, conformational studies, molecular complexes, and intermolecular forces.
