Quick Reference to Wound Care Lippincott Williams & Wilkins

Abstract Problem: Inaccurate and incomplete pressure injury (Prl) assessment and documentation leads to inaccurate reporting of Prl quality reporting measures to the Centers for Medicare and Medicaid Services. Inaccurate, incomplete documentation of pressure injuries and wounds adversely affects the quality of care, financial reimbursement, and hospital reputation as well as increasing the

risk of litigation to medical providers. Barriers to accurate and complete documentation by the nurses were inaccuracy in identification of PrIs Stage 1 or greater and knowing what and where to document the information in the electronic medical record. Context: This quality improvement project attempted to improve nurse admission skin assessment and documentation skills in a 48-bed inpatient rehabilitation hospital (IRH). The IRH is a regional referral center for 22 hospitals in the health care system. They are a specialty unit caring for persons who are at high risk of developing pressure injuries due to their diagnoses of acquired brain injuries, strokes, spinal cord injuries and other neurological disorders. Interventions: The interventions for this project were the development and implementation of an interactive wound assessment education program and wound/Prl documentation algorithm. Measures: A bundle of three measures included accurate identification of PrI's, complete documentation on the Shift Rehab Flow Sheet, and the Wound Flow Sheet. The medical records of 100% of newly admitted patients were reviewed for accurate identification and completeness of wound and PrI documentation, as verified by 2 RNs, and confirmed by the Certified Wound Ostomy Continence nurse's documentation. Results: The overall goal of this quality improvement project was to have complete, accurate identification and documentation of 80% of pressure injuries by the nurse at the point of the patients admission to the rehabilitation unit. This quality improvement project resulted in an increase in accurate and complete pressure injury identification and documentation to 100% for the past five months. Documentation for non-pressure related wounds rose from a baseline of 20% to 78% over a 9-month period. Using Improvement Science and Evidence Based Practice that included the implementation of an interactive education program, and the use of a Wound Documentation Algorithm, a significant improvement was seen in this units accuracy and completeness of documentation. Conclusions: In our environment of value-based payment and focus on patient-centered care, it is essential that nurses are knowledgeable and can competently assess and accurately document and treat pressure injuries in a timely manner. The avoidance of litigation costs and potential financial penalties imposed by regulating agencies such as the Centers for Medicare and Medicaid Services, is well worth the time and investment of this quality improvement project for the patients, nurses and IRH.

Fast Facts for Wound Care Nursing CRC Press

This open access book aims to provide a comprehensive but practical overview of the knowledge required for the assessment and management of the older adult with or at risk of fragility fracture. It considers this from the perspectives of all of the settings in which this group of patients receive nursing care. Globally, a fragility fracture is estimated to occur every 3 seconds. This amounts to 25 000 fractures per day or 9 million per year. The financial costs are reported to be: 32 billion EUR per year in Europe and 20 billion USD in the United States. As the population of China ages, the cost of hip fracture care there is likely to reach 1.25 billion USD by 2020 and 265 billion by 2050 (International Osteoporosis Foundation 2016). Consequently, the need for nursing for patients with fragility fracture across the world is immense. Fragility fracture is one of the foremost challenges for health care providers, and the impact of each one of those expected 9 million hip fractures is significant pain, disability, reduced quality of life, loss of independence and decreased life expectancy. There is a need for coordinated, multi-disciplinary models of care for secondary fracture prevention based on the increasing evidence that such models make a difference. There is also a need to promote and facilitate high quality, evidence-based effective care to those who suffer a fragility fracture with a focus on the best outcomes for recovery, rehabilitation and secondary prevention of further fracture. The care community has to understand better the experience of fragility fracture from the perspective of the patient so that direct improvements in care can be based on the perspectives of the users. This book supports these needs by providing a comprehensive approach to nursing practice in fragility fracture care.

Wound Management John Wiley & Sons

The day-to-day responsibility for wound management is a role usually undertaken by nurses. It includes assessing the wound, selecting an appropriate treatment, and evaluating the patients' progress. In order to do this effectively the nurse needs to understand the healing process, recognize the factors which may delay wound healing, understand how wound healing can be optimized, know how to recognize complications if they arise and know how to treat them. This text, specifically written for community nurses, including practice nurses, provides a picture of wound healing for both acute and chronic wounds that may be encountered in a community setting. An overview of the function of the skin and phases of wound healing are examined prior to looking at the relationship between wound healing and the patients' health and lifestyle. The reference is written in a question-

and-answer format, and includes relevant case studies.

"Nurses play a vital role in improving the safety and quality of patient care -- not only in the hospital or ambulatory treatment facility, but also of community-based care and the care performed by family members. Nurses need know what proven techniques and interventions they can use to enhance patient outcomes. To address this need, the Agency for Healthcare Research and Quality (AHRQ), with additional funding from the Robert Wood Johnson Foundation, has prepared this comprehensive, 1,400-page, handbook for nurses on patient safety and quality -- Patient Safety and Quality: An Evidence-Based Handbook for Nurses. (AHRQ Publication No. 08-0043)." - online AHRQ blurb, <http://www.ahrq.gov/qual/nursesfdbk/>
