Be prepared to meet the
ARRT competency
requirements! These
procedure checklists make it
easy. To qualify for your
certification exam, you must

demonstrate your
competency in all 36
mandatory procedures and
in at least 15 of the 30
elective procedures—and
your instructors must verify
your proficiencies. First, you
can use the checklists to
review the procedures in
preparation for the exam
and to develop decision-
making skills that will
produce the highest quality
radiographs while
considering the needs and
limitations of the patient.
Then, your instructors can
use them to record their
evaluation of your
competency for each
procedure. And, finally,
program directors can use
them to verify to the ARRT
that the you have
demonstrated the required
competencies and
proficiencies.

principles and methodology, it covers stem cell interactions, fabrication technologies, design principles, physical characterisation and biological evaluation, across a broad variety of systems and biomaterials. Topics include: stem cell biology, including embryonic stem cells, IPS, HSC and progenitor cells; modern scaffold structures, including biopolymer, bioceramic, micro- and nanofiber, ECM and biohydrogel; advanced fabrication technologies, including computer-aided tissue engineering and organ printing; cutting-edge drug delivery systems and gene therapy techniques; and medical applications spanning hard and soft tissues, the cardiovascular system and organ regeneration. With a contribution by Nobel laureate Shinya Yamanaka, this is a must-have reference for anyone in the

field of biomaterials, stem cell biology and engineering, tissue engineering and regenerative medicine. The Fundamentals of Imaging Physics and Radiobiology Cambridge University Press Provides guidelines for obtaining high-quality mammographic images while exposing patients to reasonable amounts of radiation. Appropriate physics measurements, responsibilities, and proper as well as time-efficient measurement techniques are discussed. Radiographic Image Production and Manipulation Cengage Learning Computed tomography (CT) is a powerful technique providing precise and confident diagnoses. The burgeoning use of CT has resulted in an exponential increase in

collective radiation dose to the population. Despite investigations supporting the use of lower radiation doses, surveys highlight the lack of proper understanding of CT parameters that affect radiation dose. Dynamic advances in CT technology also make it important to explain the latest dose-saving strategies in an easy-to-comprehend manner. This book aims to review all aspects of the radiation dose from CT and to provide simple rules and tricks for radiologists and radiographers that will assist in the appropriate use of CT technique. The second edition includes a number of new chapters on the most up-to-date strategies and technologies for radiation dose reduction while

updating the outstanding contents of the first edition. Vendor perspectives are included, and an online image gallery will also be available to readers. Health Sciences Report No. 147 (2004) presents recommendations and technical information related to the design and installation of structural shielding for facilities that use x rays for medical imaging. The purpose of structural shielding is to limit radiation exposure to employees and members of the public. The information supersedes the recommendations that address such facilities in NCRP Report No. 49, Structural Shielding Design and Evaluation for Medical Use of X Rays and Gamma Rays of Energies Up to 10 MeV, which was issued in September 1976. NCRP Report No. 147 includes a discussion of the various factors to be considered

in the selection of appropriate shielding materials and in the calculation of barrier thicknesses. The Report presents the fundamentals of radiation shielding, discusses shielding design goals for controlled and uncontrolled areas in or near x-ray imaging facilities and defines the relationship of these goals to the NCRP effective dose limits for radiation workers and members of the public. The Report includes a detailed discussion of the recommended shielding design methodology for x-ray imaging facilities and provides an extensive collection of shielding data and sample shielding calculations for various types of x-ray imaging facilities. The Report is mainly intended for those

individuals who specialize in radiation protection. However, it will also be of interest to architects, hospital administrators and related professionals concerned with the planning of new facilities that use x rays for medical imaging.
