The following dissertation concerning the Trinity, as the reader ought to be informed, has been written in order to guard against the sophistries of those who disdain to begin with faith, and are deceived by a crude and perverse love of reason. Now one class of such men endeavor to transfer to things incorporeal and spiritual the ideas they have formed, whether through experience of the bodily senses, or by natural human wit and diligent quickness, or by the aid of art, from things corporeal; so as to seek to measure and conceive of the former by the latter. This volume contains contributions based on presentations made at the conference on multidisciplinary aspects of information theory held in Cottbus, Germany, March 1994, and organized by the German Society for System Research and the Working Group for Physics and Computer Science. The papers have been carefully revised after a second discussion procedure and they present important information on theoretical, physical, biological, philosophical, linguistical and

sociological basic properties of information. Most of the papers aim at presenting a coherent system-theoretical understanding of information as an entity in computer science as well as in physics. The outlines of a theory of pragmatic information are also developed.

Until recently, the philosophy and history of science proceeded in a separate way from the philosophy and history of technology, and indeed with respect to both science and technology, philosophical and historical inquiries were also following their separate ways. Now we see in the past quarter-century how the philosophy of science has been profoundly influenced by historical studies of the sciences, and no longer concerned so single-mindedly with the analysis of theory and explanation, with the relation between hypotheses and experimental observation. Now also we see the traditional historical studies of technology supplemented by philosophical questions, and no longer so plainly focussed upon contexts of application, on invention and practical engineering, and on the mutually stimulating relations between technology and society. Further, alas, the neat division of intellectual

labor, those clearly drawn distinctions between science and technology, between the theoretical and the applied, between discovery and justification, between internalist and externalist approaches . . . all, all have become muddled! Partly, this is due to internal revolutions within the philosophy and history of science (the first result being recognition of their mutual relevance). Partly, however, this state of 'muddle' is due to external factors: science, at the least in the last half-century, has become so intimately connected with technology, and technological developments have created so many new fields of scientific (and philosophical) inquiry that any critical reflection on scientific and technological endeavors must henceforth take their interaction into account.

It ' s a simple agreement: for one month, Silas is my boyfriend of convenience. Once this is over, we ' ll go our separate ways. It ' s fake, after all. I need some arm candy to prove to my ex-fiancé that I ' ve moved on. He needs his old-fashioned boss to think he ' s ready to settle down. Perfect, right? Except for one minor detail: we can ' t stand each other. Silas thinks I ' m a stuck-up ice queen. I think he ' s a cocky, obnoxious jerk who ' s always trying to charm his way out of trouble – and succeeding. He ' s the beloved golden boy. I ' m the awkward new girl in town. It would be the worst idea ever, except... everyone falls for it. That ' s the thing about pretending to date someone: it looks just like real dating. And the other thing about pretending to date someone? It feels like real dating. The heated kisses in my office: fake. The possessive way he touches me: fake. The night we spend together in a hotel bed: ...maybe not so fake. One month. Then this charade is over.

The Kabbalah has long languished in darkness, unknown outside the confines of Jewish Mysticism and the communities who practiced it. But today, the Kabbalah is well-known but often misunderstood. The story of

Kabbalah is as old as Judaism itself, with many of the ideas present in the Hebrew Scriptures interpreted in the canon of Kabbalah. Applying Jewish theological premises and Neo-Platonist cosmology, the Kabbalists created a systematic interpretation of familiar Creation Narrative in the Book of Genesis, which today illuminates and serves Judaism. At the same time, Kabbalistic concepts have entered mainstream consciousness with great interest expressed in mainstream Christianity and even in modern science.

When examining the picture, use an adequate light table or picture monitor. Do not examine x-rays, for example, against a window. The background lighting should be dim. Always compare present abnormalities with findings in earlier x-rays if they are available. Was the abnormality present already in the earlier x-ray? Has it become larger or declined? Interpretation of the chest x-ray is not simple. Ask for interpretation by a radiologist if necessary. A chest x-ray that appears normal at first sight may hide significant pathology, e.g. behind the heart, mediastinum or diaphragm. Erroneous interpretation of an x-ray image is often associated with problems of perception. Many normal structures (e.g. cross-sections of blood vessels) and/or their superimposed projections may also cause false positive interpretations. The radiation dose from a chest x-ray is rather low (postero-anterior x-ray about 0.03 mSv, corresponding to 3 days' natural background radiation, and lateral x-ray about twice as much).

Scientific knowledge grows at a phenomenal pace--but few books have had as lasting an impact or played as important a role in our modern world as *The Mathematical Theory of Communication*, published originally as a paper on communication theory more than fifty years ago. Republished in book form shortly thereafter, it has since gone through four hardcover and sixteen paperback printings. It is a revolutionary work, astounding in its foresight and contemporaneity. The University of

Illinois Press is pleased and honored to issue this commemorative reprinting of a classic.

DEVELOPING ORGANIZATIONS: DIAGNOSIS AND ACTION Aeterna Press

What distinguishes clever computers from stupid people (besides their components)? The author of *Seeing and Knowing* presents in his new book a beautifully and persuasively written interdisciplinary approach to traditional problems--a clear-sighted interpretation of information theory. Psychologists, biologists, computer scientists, and those seeking a general unified picture of perceptual-cognitive activity will find this provocative reading. The problems Dretske addresses in *Knowledge and the Flow of Information*--What is knowledge? How are the sensory and cognitive processes related? What makes mental activities mental?--appeal to a wide audience. The conceptual tools used to deal with these questions (information, noise, analog versus digital coding, etc.) are designed to make contact with, and exploit the findings of, empirical work in the cognitive sciences. A concept of information is developed, one deriving from (but not identical with) the Shannon idea familiar to communication theorists, in terms of which the analyses of knowledge, perception, learning, and meaning are expressed. The book is materialistic in spirit--that is, spiritedly materialistic--devoted to the view that mental states and processes are merely special ways physical systems have of processing, coding, and using information.

When we hear such expressions as feelings of inferiority and insecurity, striving for self-enhancement and power, woman's revolt against her feminine role, the oversolicitous mother, the dethronement of the first-born, the need for affection; when maladjustment is spoken of as self-centeredness, psychological health as other-centeredness; psychiatry as the science of interpersonal relations, neurotic symptoms as ego-defenses and forms of aggression, to mention only a few instances—we are meeting ideas in which Alfred Adler

was the pioneer from 1907, the date of his first important publication, until his death in 1937. The purpose of the present volume is to make Adler's contributions to the theory and practice of psychology available in a systematic and at the same time authentic form. To this end we made selections from his writings and organized them with the aim of approximating the general presentation of a college textbook. Because every word in the main body of the work is Adler's, the outcome of our efforts, if we have been successful, should be the equivalent of a textbook by Adler on Individual Psychology, the name which he gave to his system.

Buckland offers an examination of information systems that is comparative rather than narrowly technical in approach. Using explicitly defined terms, he interprets the nature of retrieval-based information systems such as archives, libraries, databases, and museums, and their relationships to their social context. Since the primary focus of the work is on unusual examples of information systems, the discussion yields interesting and thoughtful conclusions on the nature of information systems in general and constructive consideration of existing problems in this rapidly expanding field.
