The IC-7300 has created something of a revolution in the amateur radio world. With this radio, Icom provides the advantages of SDR technology in a format that is familiar for users of their earlier transceivers. Most importantly the IC-7300 has many features that were previously only available on much more expensive radios.

Mobile robots navigation includes different interrelated activities:
(i) perception, as obtaining and interpreting sensory information;
(ii) exploration, as the strategy that guides the robot to select the next direction to go;
(iii) mapping, involving the construction of a spatial representation by using the sensory information

perceived; (iv) localization, as the strategy to estimate the robot position within the spatial map;
(v) path planning, as the strategy to find a path towards a goal location being optimal or not;
and (vi) path execution, where motor actions are determined and adapted to environmental changes. The book addresses those activities by integrating results from the research work of several authors all over the world. Research cases are documented
