This book presents the papers from the Internal Combustion
Engines: Performance, fuel economy and emissions held in London,
UK. This popular international conference from the Institution of
Mechanical Engineers provides a forum for IC engine experts
looking closely at developments for personal transport applications,
though many of the drivers of change apply to light and heavy duty,
on and off highway, transport and other sectors. These are exciting
times to be working in the IC engine field. With the move towards
downsizing, advances in FIE and alternative fuels, new engine
architectures and the introduction of Euro 6 in 2014, there are plenty
of challenges. The aim remains to reduce both CO2 emissions and
the dependence on oil-derivate fossil fuels whilst meeting the future,
more stringent constraints on gaseous and particulate material
emissions as set by EU, North American and Japanese regulations.
How will technology developments enhance performance and shape

the next generation of designs? The book introduces compression and
internal combustion engines' applications, followed by chapters on the
challenges faced by alternative fuels and fuel delivery. The remaining
chapters explore current improvements in combustion, pollution
prevention strategies and data comparisons.
