Biomass can be used
to produce
renewable
electricity,
thermal energy,
transportation
fuels (biofuels),
and high-value
functional
chemicals. As an
energy source,
biomass can be used
either directly via
combustion to
produce heat or
indirectly after it
is converted to one
of many forms of
bioenergy and
biofuel via
thermochemical or
biochemical
pathways. The
conversion of
biomass can be
achieved using
various advanced

methods, which are
broadly classified
into thermochemical
conversion,
biochemical
conversion,
electrochemical
conversion, and so
on. Advanced
development
technologies and
processes are able
to convert biomass
into alternative
energy sources in
solid (e.g.,
charcoal, biochar,
and RDF), liquid
(biodiesel, algae
biofuel,
bioethanol, and
pyrolysis and
liquefaction bio-
oils), and gaseous
(e.g., biogas,
syngas, and
biohydrogen) forms.
Because of the
merits of biomass
energy for
environmental
sustainability,
biofuel and
bioenergy
technologies play a
crucial role in
renewable energy
development and the
replacement of
chemicals by highly
functional biomass.
This book provides

a comprehensive
overview and in-
depth technical
research addressing
recent progress in
biomass conversion
processes. It also
covers studies on
advanced techniques
and methods for
bioenergy and
biofuel production.

These proceedings are
based on the third of
a series of symposia
devoted to the use of
catalysis for the
depollution of

exhaust gases of motor vehicles. Although catalysts have been used for this purpose for some thirty years, the subject is still very topical because of its economic impact. The increasing number of submitted, accepted and published papers amply attests to this fact.

This book presents recent developments in the areas of engineering and technology, focusing on experimental, numerical, and theoretical approaches. In the first part, the emphasis is on the emerging area of electromobility and its sub-disciplines, e.g. battery development, improved efficiency due to new designs and materials, and intelligent control approaches. In turn, the book's second part addresses the broader topic of energy conversion and generation based on classical (petrol

engines) and more modern approaches (e.g. turbines). The third and last part addresses quality control and boosting engineering efficiency in a broader sense. Topics covered include e.g. modern contactless screening methods and related image processing. *Yachting Centre for Advanced Research on Energy*
This book offers a comprehensive and timely overview of internal combustion engines for use in marine environments. It reviews the development of modern four-stroke marine engines, gas and gas-diesel engines and low-speed two-stroke crosshead engines, describing their application areas and providing readers with a useful snapshot of their technical features, e.g. their dimensions, weights, cylinder arrangements, cylinder capabilities, rotation speeds, and exhaust gas temperatures. For each marine engine, information is provided on the

manufacturer, historical background, development and technical characteristics of the manufacturer's most popular models, and detailed drawings of the engine, depicting its main design features. This book offers a unique, self-contained reference guide for engineers and professionals involved in shipbuilding. At the same time, it is intended to support students at maritime academies and university students in naval architecture/marine engineering with their design projects at both master and graduate levels, thus filling an important gap in the literature.
